Preface

This guide describes how to configure each feature of the AC1200 Dual Band Gigabit Enterprise Wireless Router (W18E). The contained images and UI screenshots are subject to the actual products.

Features available in the router may vary by model and software version. Router availability may also vary by region or ISP. All images, steps, and descriptions in this guide are only examples and may not reflect your actual router experience.

Conventions

The typographical elements that may be found in this document are defined as follows.

Item	Presentation	Example
Cascading menus	>	System > Live Users
Parameter and value	Bold	Set User Name to Tom .
Variable	Italic	Format: <i>XX:XX:XX:XX:XX:XX</i>
UI control	Bold	On the Policy page, click the OK button.
Message	“ ”	The “Success” message appears.

The symbols that may be found in this document are defined as follows.

Symbol	Meaning
	This format is used to highlight information of importance or special interest. Ignoring this type of note may result in ineffective configurations, loss of data or damage to device.
	This format is used to highlight a procedure that will save time or resources.

More information and support

Visit www.tendacn.com and search for the product model to get your questions answered and get the latest documents.

Revision history

Tenda is constantly searching for ways to improve its products and documentation. The following table indicates any changes that might have been made since the user guide was released.

Version	Date	Description
V2.1	2025-09-25	– Added the description of configuring VLAN rules, switching operating mode, configuring Cloud VPN. – Optimized the description of modifying IPv4 internet connection, configuring the main WiFi, setting up a guest WiFi, configuring authentication type, configuring authentication account, VPN.
V1.0-2.0	2023-2025	Historical versions.

1 Login and logout

1.1 Log in to the web UI

If you use this router for the first time or have reset it to factory settings, refer to the quick installation guide (visit www.tendacn.com to download) to complete the setup wizard. Otherwise, refer to the following steps.

1.1.1 Log in with your computer

1. Connect your computer to a LAN port of the router with an Ethernet cable, or connect your computer to the wireless network of the router.
2. Start a browser on the computer and enter **tendawifi.com** in the address bar to access the web UI.

3. Enter the login password of the router you set, and click **Log in**.

- By default, the WiFi password is set as the login password automatically. Thus, if you forget the login password, try to use the WiFi password.
- If the problem persists, [reset the router to factory settings](#) and then set the login password. After resetting, you need to connect the router to the internet again.

-----End

If the above page does not appear, try the following solutions:

- Ensure that the router is powered on.
- Ensure that the Ethernet port of the router is connected to the computer correctly and securely.
- Ensure that your computer has been set to **Obtain an IP address automatically** and **Obtain DNS server address automatically**.
- [Reset the router to factory settings](#), and log in again. After resetting, you need to connect the router to the internet again.

Log in to the web UI successfully. See the following figure.

1.1.2 Log in with your smartphone

1. Connect your smartphone to the WiFi network of the router.
2. Start the browser on the smartphone and enter **tendawifi.com** in the address bar (not searching bar) to access the web UI.
3. Enter the login password of the router you set, and click **Log in**.

- By default, the WiFi password is set as the login password automatically. Thus, if you forget the login password, try to use the WiFi password.
- If the problem persists, [reset the router to factory settings](#) and then set the login password. After resetting, you need to connect the router to the internet again.

-----End

TIP

If the above page does not appear, try the following solutions:

- Ensure that the router is powered on properly.
- Ensure that your smartphone is connected to the wireless network of the router.
- Ensure that the mobile data is disabled.
- [Reset the router to factory settings](#), and log in again. After resetting, you need to connect the router to the internet again.

Log in to the web UI successfully. See the following figure.

TIP

Please scale the page to fit the screen size.

1.2 Web UI

1.2.1 Web UI layout

The web UI of the router consists of three sections, including the level-1, level-2, level-3 navigation bar, and configuration area. See the following figure:

Features or parameters displayed in gray are not available or cannot be configured under the current condition.

No.	Name	Description
1	Level-1 navigation bar	Used to display the function menu of the router. Users can select functions in the navigation bars and the configuration appears in the configuration area.
2	Level-2 navigation bar	
3	Level-3 navigation bar	
4	Configuration area	Used to modify or view your configuration.

1.2.2 Frequently-used buttons

The following table describes the frequently-used buttons available on the web UI of the router.

Button	Description
	Used to add a new rule or policy.
	Used to save the configuration on the current page and enable the configuration to take effect.
	Used to delete the selected rule or policy.
	Used to change the current configuration on the current page back to the original configuration.
	Used to edit corresponding rules, policies or information.
	Used to view help information for the current page.

1.3 Logout

If you log in to the web UI of the router and perform no operation within the [Login Timeout](#), the router logs you out automatically. You can also log out by clicking **Exit** at the upper right corner of the web UI.

2 System status

Features available in the router may vary by model and software version. Router availability may also vary by region or ISP. All images, steps, and descriptions in this guide are only examples and may not reflect your actual router experience.

2.1 View network status

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **System**.

In the **Network Status** module, you can check if the WAN port network status is proper, and view basic information about the router and the secondary node.

2.1.1 View network connection status

When the link between the **Internet** and the **Router** is clear as shown below, the router is connected to the internet properly.

When a red cross and "**Disconnected**" are shown between the **Internet** and the **Router**, the router is disconnected from the internet. Check whether the Ethernet cable is connected properly.

You can click the line between **Internet** and **Router** to redirect to the [Internet Settings](#) to check the internet configuration.

2.1.2 View router (cable-free primary node) information

In the **Network Status** module, click the **Router** icon, and view [Running Status](#) and [WiFi Status](#) of the router.

View running status

In the **Running Status** module, you can view such information as system time, running duration, operating mode and firmware about the router.

Running Status	
System Time	2025-07-23 10:46:20
Running Duration	1day(s) 2hour(s) 2minute(s)
Operating Mode	Router Mode
Firmware	V16.01.0.13(3742)
Device Name	W18E
CPU Utilization	10%
Memory Utilization	53%
SN	
Cloud status	Not enabled

View WiFi status

In the **WiFi Status** module, you can view the WiFi status of the router.

WiFi Status						
RF	SSID	WiFi Protocol	Channel	Channel Bandwidth	Security Mode	RF Status
2.4G	Tenda_D136A0	WiFi 4 (802.11b/g/n)		20MHz	None	Enabled
5G	Tenda_D136A0	WiFi 5 (802.11a/n/ac)		80MHz	None	Enabled

Parameter description

Parameter	Description
RF	Specifies the operating frequency of the router.
SSID	Specifies the WiFi name of the router.
WiFi Protocol	Specifies the WiFi protocol of the router.
Channel	Specifies the channel for wireless data transmission of the router.
Channel Bandwidth	Specifies the channel bandwidth of the wireless channel of the router.
Security Mode	Specifies the encryption mode of the WiFi network.
RF Status	Specifies whether the WiFi function of the router is enabled.

2.1.3 View secondary router (cable-free secondary node) information

In the **Network Status** module, you can click the **Extend Secondary Node** icon, and view [Running Status](#), [LAN Status](#) and [Link Quality](#) of the router.

View LAN status

In the **LAN Status** module, you can view the LAN IP address and the MAC address of the secondary node.

LAN Status	
IP Address	192.168.0.97
MAC Address	

View link quality

In the **Link Quality** module, you can view the link information between the secondary node and the upstream node.

Link Quality	
Upstream Node MAC Address	
Uplink Type/Strength	5GHz/ -26dBm
Negotiation Rate	866Mbps

Parameter description

Parameter	Description
Upstream Node MAC Address	Specifies the MAC address of the upstream node used to form the Mesh link.
Uplink Type/Strength	Specifies the networking mode between this node and the upstream node, and the signal strength of the upstream node received by this node.
Negotiation Rate	Specifies the current negotiation rate between this node and the upstream node.

2.2 View interface information

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **System**.

In the **Interface Info** module, you can view the roles, physical connection status, upload rate and download rate of each port of the router.

Interface Info				
Interface				
	WAN1	LAN2	LAN3	LAN4
Upload Rate	234B/s	0B/s	21B/s	0B/s
Download Rate	3.32KB/s	0B/s	378B/s	0B/s

- Green means connected.
- Grey means disconnected.

2.3 View WAN real-time rate

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **System**.

In the **WAN Real-time Rate** module, you can view the upload and download rates of a WAN port of the router.

If you set [multiple WAN ports](#), click the drop-down box of the **WAN Real-time Rate** to select a certain WAN port of the router.

2.4 View WAN connection status

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **System**.

In the **Connection Status** module, you can view the network status of the corresponding WAN port IPv4, including the Ethernet port connection rate and duplex mode, connection status, duration and IP address.

If you set [multiple WAN ports](#), click the drop-down box of the [WAN Real-time Rate](#) to select a certain WAN port of the router.

Parameter description

Parameter	Description
Hardware Connection	Specifies the negotiation rate and duplex mode of the WAN port. If the display is abnormal, you can troubleshoot based on the information on the page and the current environment.

Parameter	Description
Status	Specifies the connection status of the WAN port of the router.
	– Connected: The WAN port of the router has been plugged into the Ethernet cable, and the IPv4 address information has been obtained.
	– Connecting...: The router is connecting to the upstream network device.
	– Disconnected: If it is not connected or fails to connect, check the Ethernet cable connection status and internet settings, or consult the corresponding ISP.
	If other status information is displayed, take corresponding measures according to the network status prompt information.
Duration	Specifies the latest duration of the WAN port access to the IPv4 network.
IP Address	Specifies the IPv4 address of the WAN port.
Subnet Mask	Specifies the subnet mask of the WAN port.
Default Gateway	Specifies the IPv4 gateway address of the WAN port.
Primary DNS	Specify the primary/secondary DNS server address of the WAN port.
Secondary DNS	

2.5 Manage terminal devices

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **System**.

In the **Main Network Device** module, you can view and manage the users connected to the router.

When you view or manage users, you can enter the terminal name, IP address, MAC address in the search bar to quickly filter user information.

Main Network Device (5) Blocked Device (0)									
Limit All Search Traffic Statistics: ☐									
Terminal Name	Terminal Type	Remark	IP Address	MAC Address	Online Duration	Real-time Upload	Real-time Download ↓	Status	Operation
 MININT-DBPIBV1	Others	–	192.168.0.210	08:EA:40:FC:1A:BF	20minute(s)	0KB/s	1KB/s	Online	Limit Speed Blacklist

2.5.1 Control bandwidth of terminal devices

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **System**. locate the devices as required on the **Main Network Device** module, and click **Limit Speed**.

Main Network Device (5) Blocked Device (0)											
Terminal Name	Terminal Type	Remark	IP Address	MAC Address	Online Duration	Real-time Upload	Real-time Download ↓	Status	Operation		
MININT-DBPIBV1	Others	-	192.168.0.210	08:EA:40:FC:1A:BF	20minute(s)	0KB/s	1KB/s	Online	Limit Speed	Blacklist

2.5.2 Restrict internet access time for terminal devices

- Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
- Go to **System**. Locate the devices as required on the **Main Network Device** module, and click **Blacklist**.

Main Network Device (5) Blocked Device (0)											
Terminal Name	Terminal Type	Remark	IP Address	MAC Address	Online Duration	Real-time Upload	Real-time Download ↓	Status	Operation		
MININT-DBPIBV1	Others	-	192.168.0.210	08:EA:40:FC:1A:BF	20minute(s)	0KB/s	1KB/s	Online	Limit Speed	Blacklist

2.6 View traffic statistics

The **Traffic Statistics** function is disabled by default. It may affect router performance after you enable it.

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **System**.

In the **Main Network Device** module, you can view the total download statistics of each terminal devices after the **Traffic Statistics** function is enabled. The function is disabled by default. When it is enabled, the page is shown as below.

3 Internet settings

Features available in the router may vary by model and software version. Router availability may also vary by region or ISP. All images, steps, and descriptions in this guide are only examples and may not reflect your actual router experience.

3.1 Internet Settings

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **Network > Internet Settings**.

You can configure or change the internet settings to enable the router to access the internet.

3.1.1 Configure WAN ports

The multi-WAN port feature allows you to aggregate bandwidth, enjoy uninterrupted broadband service even in case of connection malfunction, and make ISP route selection, thus getting better utilization of your bandwidth.

The screenshot shows the 'Internet Settings' page. Under the 'No. of WAN Ports' section, the 'Interface' is set to 'Gigabit Ethernet Port'. The 'No. of WAN Ports' dropdown menu is set to '1' and is highlighted with a red dashed box. Below this, the 'Port Status' section shows four port icons: WAN 1 (green), LAN 2 (grey), LAN 3 (green), and LAN 4 (grey). The WAN 1 and LAN 3 ports are active, while LAN 2 and LAN 4 are inactive.

Parameter description

Parameter	Description
Interface	Specifies the rate type of the WAN port on the router.

Parameter	Description
No. of WAN Ports	Specifies the number of WAN ports. By default, the router has only one WAN port (the WAN1 port), and you can set 3 WAN ports at most.
Port Status	Specifies the port type and the connection status.  : The port is connected properly.  : The port is disconnected or improperly connected.

3.1.2 Modify IPv4 internet connection

Choose the proper ISP type and connection type according to your actual environment. All internet parameters for accessing the internet are provided by your ISP. If you are not clear, consult your ISP.

PPPoE, **Dynamic IP Address** and **Static IP Address** are used for illustration here.

WAN1 is used as an example here, and configurations for other WAN ports are similar.

Configuration procedure:

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **Network > Internet Settings**.
3. Choose the proper ISP type and connection type according to your actual environment.
 - **PPPoE:** If your ISP provides no setup information, except for the PPPoE user name and password, you can choose this connection type to access the internet.
 - 1) Set the **ISP Type**, which is **Normal** in this example.
 - 2) Set **Connection Type** to **PPPoE**.
 - 3) Enter the **PPPoE User name** and **PPPoE Password** provided by your ISP.
 - 4) Click **Connect**.
 - **Dynamic IP Address:** If the ISP dynamically assigns you the IP address information, you can choose this connection type to access the internet.
 - 1) Set the **ISP Type**, which is **Normal** in this example.
 - 2) Set **Connection Type** to **Dynamic IP Address**.
 - 3) Click **Connect**.

- **Static IP Address:** If your ISP provides no setup information, except for the fixed IP address, subnet mask, default gateway and DNS server information, you can choose this connection type to access the internet.

- 1) Set the **ISP Type**, which is **Normal** in this example.
- 2) Set **Connection Type** to **Static IP Address**.
- 3) Enter the **IP Address, Subnet Mask, Default Gateway** and **Primary/Secondary DNS** provided by your ISP.
- 4) Click **Connect**.

----End

Wait a moment. When the **Status** shows **Connected**, the router is connected to the internet successfully.

Parameter description

Parameter	Description
ISP Type	Specifies the type of your ISP, such as Normal, Russia, Unifi, Maxis and Manual. Parameters required for each option may differ. Refer to the following to choose your connection type: – Normal, Unifi and Maxis: Select these options when your ISP provides no setup information, except for the PPPoE user name and password, or static IP address information. – Russia: Select this option when your ISP provides dual access information, such as PPTP, L2TP connection information. – Manual: Select this option when your ISP provides VLAN ID information, besides the PPPoE user name and account, or static IP address. If you are still not sure, contact your ISP for help.  TIP – Unifi and Maxis are ISPs of Malaysia, only applicable when you choose the ISPs. – Russia is only applicable to Russia and its vicinity.
Connection Type	Specifies in which way the router is connected to the internet. – PPPoE: Select this type if you access the internet using the PPPoE user name and PPPoE password. – Dynamic IP Address: Select this type if you can access the internet by simply plugging in an Ethernet cable. – Static IP Address: Select this type if you want to access the internet using fixed IP information. – Russia PPPoE, Russia PPTP and Russia L2TP: They are available only when you set ISP Type to Russia. The specific configuration is completed according to the requirements of the ISP.

Parameter	Description
PPPoE User name	These parameters are required only when your internet connection type is PPPoE or PPPoE Russia .
PPPoE Password	You can obtain them from your ISP.
Server Name	These parameters are required only when your internet connection type is PPPoE or PPPoE Russia . Enter these two parameters (optional) provided by your ISP.
Service Name	
IP Obtain Type	Specifies in which way the router obtain the IP address. This parameter is required only when your internet connection type is PPPoE Russia, Russia PPTP or Russia L2TP. – Dynamic IP: The IP address is assigned by the ISP's DHCP server. – Static IP: you need to manually configure the fixed IP address, subnet mask, default gateway, primary DNS and secondary DNS.
IP Address	These parameters are required only when your internet connection type is Static IP Address , or IP obtain type is Static IP . Enter these parameters provided by the ISP.
Subnet Mask	
Default Gateway	
Primary DNS	
Secondary DNS	
Dedicated Line	Supported only on WAN2/WAN3. After enabling it, go to More > Advanced Routing > WAN Parameters to switch WAN2/WAN3 to Local Network Mode. This mode is designed for internal networks (e.g., medical, education, or government private lines) that use private IP addresses and cannot access the public internet. Note: If Intelligent Load Balancing is enabled in Multi-WAN policy, dedicated lines may fail. It is recommended to add static routing rules to specify the routing path for dedicated lines.

3.2 LAN settings

3.2.1 View LAN port status

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **Network > LAN Settings**.

In the **LAN Port Status** module, you can view the number of LAN ports, the port type and the connection status of the router.

- Green means connected.
- Grey means disconnected.

3.2.2 Modify LAN IP address of the router

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **Network > LAN Settings**.

In the **Configure IP Address** module, you can view and modify the LAN information of the router.

The LAN IP address is also the login IP address of the router. The default LAN IP address is **192.168.0.1**.

TIP

In case of IP address conflict, for example, "The router's WAN IP address and LAN IP address are in the same network segment.", the IP network segment of LAN ports will automatically be incremented by 1 and changed to 192.168.1.1.

Configure IP Address

IP Address

192 . 168 . 0 . 1

Subnet Mask

255 . 255 . 255 . 0

MAC Address

Generally, you do not need to modify the router's LAN IP address. If the IP address of other network management devices on the LAN needs to be set to 192.168.0.X, you can modify this router's LAN IP address to be on different network segments from 192.168.0.X.

TIP

If the network segment of the new LAN IP address is different from the original one, the system automatically modifies the DHCP server to make it on the same network segment as the new LAN IP address.

18

Document version: V2.1

3.2.3 Modify DHCP server

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **Network > LAN Settings**.

In the **DHCP Server Settings** module, you can modify DHCP server settings.

DHCP server can automatically assign IP addresses, subnet mask, gateway and other internet parameters to devices connected to the router. If this function is disabled, you have to manually set IP address settings for your connected devices for internet access. You are recommended to enable this function.

Parameter description

Parameter	Description
DHCP Server	Used to enable or disable the DHCP server function.
Client Start IP Address	Specifies the range of IP addresses that the DHCP server can assign to a LAN device. The start IP address is 192.168.0.2 and the end IP address is 192.168.0.254 by default.
Client End IP Address	
Lease	Specifies the validity period of the IP address assigned by the DHCP server to LAN devices. By default, the default value is 30 minutes. When the IP address expires: – If the device is still connected to the network, the device will automatically renew and continue to occupy the IP address. – If the device is not connected to the network, the router will release the IP address. If other devices request IP address information, the router can assign this IP address to other devices. You are recommended to keep the default settings.

Parameter	Description
Primary DNS	Specifies the primary DNS server IP address assigned by the DHCP server to LAN devices. This router supports DNS proxy function so that the primary DNS is the LAN IP address of the router by default.  TIP Generally, you are recommended to keep the default settings. If it is necessary to change the default settings, set this parameter to a correct DNS server IP address or DNS proxy IP address, to enable connected devices to access the internet.
Secondary DNS	Specifies the secondary DNS server IP address assigned by the DHCP server to LAN devices. This parameter is optional. If it is empty, the DHCP server does not assign it to devices.

3.3 Assign a static IP to the client

With the DHCP reservation function, you can make the specified client in the LAN always obtain the preset IP address, and avoid the functions such as **Internet Speed Control** and **Port Mapping** that take effect based on the IP address from becoming invalid due to the change of the client IP address.

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **Network > DHCP Reservation**.

You can configure the DHCP static assignment rules and also import/export static IP address lists.

Click **Add** to add a new DHCP reservation policy.

Parameter description

Parameter	Description
Terminal Name	Specifies the name of the terminal.
Terminal Type	Specifies the terminal types such as Mobile Phone, PAD and PC. If the terminal type is not recognized, Others will be displayed.
IP Address	Specifies the fixed IP address to be assigned to the terminal.
MAC Address	Specifies the MAC address of the terminal. A MAC address can be specified in the following format: 00:23:24:E8:14:5A, 00-23-24-E8-14-5A or 002324E8145A.
Remark	Specifies the description of the assigned static IP address.
Status	Specifies the status of the DHCP reservation, including Enabled , Disabled and Expired .
	Used to delete the DHCP reservation policy.
	Used to import CSV files for adding DHCP static assignment rules.
	Used to export DHCP static assignment rules to your local computer as a CSV file.  TIP To modify the exported file, open the file as a txt file.

3.4 Configure VLAN rules

VLAN, abbreviated for Virtual Local Area Network, is a technology which divides LAN devices into different network segments logically rather than physically to create virtual work groups. It is used to divide the work stations in the switch-formed network into logical groups among which broadcast is isolated. Work stations in a group belong to a same VLAN and can communicate like they are connected to a same network segment no matter where they physically are. However, due to the isolation of broadcast packets, the VLAN cannot communicate with each other and packets must be forwarded by a router or other layer 3 packet forwarding devices.

This router supports 802.1Q VLAN and can communicate with devices that support 802.1Q VLAN in VLAN as well. 802.1Q VLAN is defined by IEEE 802.1q protocol. With 802.1Q VLAN, the router can process packets by identifying the tags in packets.

Methods of each port type to process packets are shown as follows.

Port type	Receiving tagged data	Receiving untagged data	Sending data
Access port			Strip the tag from the packet and then forward it
Trunk port	Forward data to the ports with VLANs assigned based on the VLAN ID	Forward data to the ports with VLANs assigned based on the PVID	VLAN ID = PVID of the port, strip the tag from the packet and then forward it VLAN ID $\neq$ PVID of the port, retain the tag in the packet and then forward it

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **Network > VLAN Settings**.

Click **Add** to create a new VLAN, and choose whether to assign LAN ports to it.

By default, the router has created a VLAN named VLAN_Default, and its VLAN ID is **1**, which cannot be modified or deleted. If VLAN=1, there is no VLAN information, only the data of the LAN port without VLAN is processed. If VLAN $\neq$ 1, only the data of the LAN port with VLAN is processed.

VLAN Settings

Port Status

1 WAN 2 WAN/LAN 3 WAN/LAN 4 LAN

WAN 1 LAN 2 LAN 3 LAN 4

VLAN_Default Joined Joined Joined

VLAN Settings

Add

VLAN Name	VLAN ID	IP Address	Subnet Mask	Remark	Allow Access	Operation
VLAN_Default	1	192.168.0.1	255.255.255.0	-	Allow	Edit Delete

Parameter description

Parameter	Description
Port Status	Specifies the connection status of the port. - Green/Orange means the port is connected properly. - Grey means the port is disconnected.

Parameter	Description
VLAN Setting	By default, the router has created a VLAN named VLAN_Default, and adds all ports to that VLAN. You can click Add to add a new VLAN policy, and select ports to join this VLAN as needed. – Not Join: Forbid the port to join the VLAN to send or receive packets with VLAN ID. – TAG: Allow the port to join multiple VLANs as a trunk port with PVID=1. A trunk port is used for connection between routers, or router and switch. For details about packet processing, refer to Methods of each port type to process packets. – UNTAG: Allow the port to join only one VLAN as an access port. An access port is used for connecting the computer. For details about packet processing, refer to Methods of each port type to process packets.  TIP If a port contains both tagged and untagged VLANs, it works as a trunk port and uses the VLAN ID of the untagged VLAN as PVID.
Interface	Specifies the name of each added VLAN ID.
VLAN ID	Specifies the identifier of VLAN and is used to separate subordinate LANs inside a LAN. Each ID represents a LAN.
IP Address	Specifies the VLAN IP address. Devices connecting to the port can log in to the web UI of the router using the IP address.
Subnet Mask	Specifies the subnet mask of the VLAN.
Remark	Specifies the description of the VLAN.
Allow Access	Specifies whether clients from other VLANs can access services of this VLAN. – Allow indicates that clients from other VLANs can access services of this VLAN. – Forbid indicates that clients from other VLANs cannot access services of this VLAN.

3.5 Switch operating mode

The router supports both Router Mode and Client+AP Mode, with Router Mode enabled by default.

- **Router Mode:**
In this mode, the router functions as a network gateway. Its WAN port is used to connect to an external network and provide internet access for local area network (LAN) devices.
- **Client+AP Mode:**
In this mode, no connection to the WAN port is required. The router wirelessly bridges to the WiFi signal of an upstream router, thereby extending the wireless network coverage. Once

extension is complete, the device operates within the same local network as the upstream router. You can check the IP address assigned to this router in the client list of the upstream router.

3.5.1 Switch to Client+AP mode

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **Network > Operating Mode**.
3. Select **Client+AP Mode**, then choose the frequency band of the target WiFi, which is 5 GHz in this example.
4. Click **Scan**.
5. Select the target WiFi from the list below. Upstream WiFi Name, Upstream Wireless MAC Address, and Encryption Type will auto-fill.
6. Enter the password for the upstream WiFi as required.
7. Click **Save**. The following figure is for reference only.

The screenshot shows the 'Operating Mode' configuration page. At the top, 'Client+AP Mode' is selected with a radio button. Below this, there are input fields for 'Frequency Band' (set to 5 GHz), 'Upstream WiFi Name' (auto-filled with '@my_wifi_5G'), 'Upstream Wireless MAC Address' (auto-filled with a greyed-out box), 'Encryption Type' (set to WPA2-PSK), and 'Upstream WiFi Password' (masked with dots). A 'Rescan' button is located below these fields. At the bottom, there is a table of detected WiFi networks with columns: Select, SSID, MAC Address, Channel Bandwidth, Channel, Security Mode, and Signal Strength. The first row is selected with a green checkmark and shows a signal strength of -4dBm. The other two rows show a signal strength of -22dBm. A blue 'Save' button is at the bottom center.

Select	SSID	MAC Address	Channel Bandwidth	Channel	Security Mode	Signal Strength
☒	@my_wifi_5G	[Redacted]	[Redacted]	[Redacted]	WPA2-PSK	-4dBm
☐	[Redacted]	[Redacted]	[Redacted]	[Redacted]	WPA2-PSK	-22dBm
☐	[Redacted]	[Redacted]	[Redacted]	[Redacted]	WPA2-PSK	-22dBm

---End

After the extension is completing, you can log in to the web UI of the router via **tendawifi.com** or its IP address (check the client list of your main router for the assigned IP). Then go to **Network > Operating Mode**, where you will see the **Connection Status** displayed as **Connected**.

To access the internet, connect your computer to a LAN port of the router, or connect your smartphone to the WiFi network of the router.

If you cannot access the internet, try the following solutions:

- Ensure that the upstream router is connected to the internet successfully.
- Ensure that your WiFi-enabled devices are connected to the WiFi network of the router.
- If the computer connected to the router for repeating cannot access the internet, ensure that the computer is set to **Obtain an IP address automatically** and **Obtain DNS server address automatically**.

3.5.2 Switch back to Router mode

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **Network > Operating Mode**.
3. Select **Router Mode**, then click **Save**.
4. Use an Ethernet cable to connect the WAN port of the router to your modem (such as optical network terminal) or Ethernet jack, then [modify internet connection](#).

---End

4 Wireless

Features available in the router may vary by model and software version. Router availability may also vary by region or ISP. All images, steps, and descriptions in this guide are only examples and may not reflect your actual router experience.

4.1 Configure the main WiFi

4.1.1 Set up a new main WiFi

WiFi Network 1 is enabled by default. To set up an additional WiFi network:

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **Wireless > Wireless Settings > WiFi Network 2**.
3. Enable **WiFi Network**.
4. Modify WiFi settings as required.
5. Click **Save**.

The screenshot shows the 'WiFi Network 2' configuration page. At the top, there are three tabs: 'WiFi Network 1', 'WiFi Network 2' (selected), and 'WiFi Network 3'. The page is titled 'Connection Settings'. It contains the following fields and options:

- SSID:** A text box containing 'Tenda_037608'.
- Security:** A dropdown menu showing 'WPA-PSK/WPA2-PSK'.
- WiFi Password:** A text box with masked characters (dots) and a toggle icon.
- Hide wireless name (SSID):** Radio buttons for 'Enable' and 'Disable' (selected).
- Isolate the WiFi Network:** Radio buttons for 'Enable' and 'Disable' (selected).
- Max. Clients:** A text box containing '48' and a help icon.
- VLAN Settings:** A toggle switch that is currently off.
- Unify 2.4 GHz & 5 GHz:** A toggle switch that is currently on.
- WiFi Network:** A toggle switch that is currently on.
- Save:** A blue button at the bottom.

-----End

Refer to the above steps to set up the **WiFi Network 3**.

4.1.2 Change the WiFi name and password

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **Wireless > Wireless Settings > WiFi Network 1**.
3. Enter a new WiFi name (**SSID**).
4. Choose a **Security** mode as required.
 - **None**: Indicates that the Wi-Fi network is not encrypted and any clients can access the network without a password. This option is not recommended as it leads to low network security.
 - **WPA-PSK**: The network is encrypted with WPA-PSK/AES. It is featured with better compatibility than WPA2-PSK
 - **WPA2-PSK**: The network is encrypted with WPA2-PSK/AES. It is featured with higher security level than WPA-PSK.
 - **WPA-PSK/WPA2-PSK**: The network adopts both WPA-PSK and WPA2-PSK.
5. Change WiFi password.
6. Click **Save**.

----End

4.1.3 Hide the main WiFi

The hidden Wi-Fi networks are invisible to Wi-Fi-enabled devices, thus improving the security of the networks. To connect a hidden Wi-Fi, see [Connect to a hidden Wi-Fi](#).

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **Wireless > Wireless Settings > WiFi Network 1**.
3. Enable the **Hide wireless name (SSID)**.
4. Click **Save**.

----End

4.1.4 Unify/separate the 2.4 GHz and 5 GHz WiFi

The router supports Unify 2.4 GHz & 5 GHz function. After enable this function, the router's 2.4GHz and 5GHz Wi-Fi names and passwords are the same, and the router will automatically select the

most appropriate band to connect to according to the distance and internet access needs of the device.

Unify 2.4 GHz & 5 GHz simplifies the network selection process, but some smart home devices may have the following compatibility issues with the Unify 2.4 GHz & 5 GHz function.

- **Device drops:** Many smart home devices only support 2.4GHz band, after enable Unify 2.4 GHz & 5 GHz, these devices may drop out frequently, resulting in the inability to use normally.
- **Unstable network:** The network will be instantly disconnected when switching bands, resulting in poor experience when playing games or swiping videos.
- **Smart devices cannot connect:** after enable Unify 2.4 GHz & 5 GHz, some smart devices cannot recognize the 2.4GHz band signal, resulting in no networking.

Therefore, it is recommended to disable the Unify 2.4 GHz & 5 GHz function in the smart home environment.

To unify/separate the main Wi-Fi networks:

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **Wireless > Wireless Settings > WiFi Network 1**.
3. To unify the main Wi-Fi networks, turn on **Unify 2.4 GHz & 5 GHz**.
4. To separate the main Wi-Fi networks, turn off **Unify 2.4 GHz & 5 GHz**.
5. Click **Save**.

----End

4.1.5 Tips

- **Isolate the WiFi Network:** Used to enable or disable the **Isolate the WiFi Network** function. After the function is enabled, users connected to the different WiFi network of the router cannot communicate with each other, which enhances the security of the WiFi network.
- **Max. Clients:** Maximum number of wireless clients that can be connected to the wireless network with the SSID at the same time. Clients connected to all the enabled wireless networks (including guest networks) of the router cannot exceed 128 on 2.4 GHz and 5 GHz bands respectively. If you enable multiple SSIDs, plan your maximum number of clients to each SSID first.
- **VLAN Settings:** If enabled, specifies the VLAN to which the WiFi network belongs.

4.2 Set up a guest WiFi

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **Wireless > Guest Network**.

You can configure the basic parameters of guest network, such as enable or disable guest network, modify the SSID, and set the WiFi password.

Clients connected to the guest network can only access the internet and other wireless clients connected to the guest network as well, and cannot access the web UI of the router or the LAN where the primary network is deployed. The guest network meets the internet requirement of guests and ensures the security of the primary network as well.

This function is disabled by default. When it is enabled, the page is shown as below.

Parameter description

Parameter	Description
Guest Network Status	Used to enable or disable the guest network.
Guest Network Settings	Specifies the WiFi name of the guest network.
	SSID  TIP To differentiate the main network and the guest network, you are recommended to set the SSIDs differently.
	Security Specifies the encryption types of the guest network
	WiFi Password Specifies the password used for wireless internet connection. You are recommended to use the combination of digits, letters and special characters for higher security.
	VLAN Settings If enabled, specifies the VLAN to which the guest WiFi belongs
Guest Network LAN Port IP Address	Unify 2.4&5 GHz SSID After this function is enabled, the 2.4 GHz guest network and the 5 GHz guest network share the same WiFi network name and password. A wireless client will be automatically connected to the WiFi network with the best network quality when connecting to the guest network.
	IP Address Specifies the IP address (default: 192.168.168.1) of the guest network. The router assigns 192.168.168.X to wireless clients connected to it. You are recommended to keep the default settings.
	Subnet Mask Specifies the subnet mask of the guest network, which is used to define the address space of the guest network.
Guest Network Bandwidth Limit	Shared Upload Rate
	Shared Download Rate Specify the uplink and downlink rate limits on guest network.
	Max. Client Specifies the maximum number of wireless devices allowed to connect to the guest network.

4.3 Configure MAC filters

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **Wireless > MAC Filters**.

Configure MAC filters rules to allow or block specific devices from connecting to the router's main Wi-Fi network.

4.3.1 Example of allowing device to connect to WiFi

Networking requirement

An enterprise uses the wireless router to set up a network.

Requirement: Only a procurement manager's computer is allowed to connect to the WiFi network (Procurement) of the router for internet access. Other staff cannot connect to the network.

Solution

The MAC filters function can meet this requirement. Assume that the physical address of the computer of the procurement manager is CC:3A:61:71:1B:6E.

Configuration procedure

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **Wireless > MAC Filters**. Enable **MAC Filters**, and click **Save**.
3. Select a MAC address filter mode for the WiFi network **Procurement**, which is **Only Allow** in this example.
4. Click **Save**.

SSID	MAC Address Filter
Procurement	Only Allow
Tenda_D136A1	Disable
Tenda_D136A2	Disable

5. Add a MAC filter rule.
 - 1) Click **Add**.
 - 2) On the **Add** configuration window, set the following parameters:
 - Set MAC Address to CC:3A:61:71:1B:6E.
 - (Optional) Set Remark to Procurement manager.
 - Select **Procurement** from the drop-down list of **Effective Network**.
 - Click **Save**.

Add

Verification

Only the before-mentioned wireless client can connect to the WiFi network **Procurement** while other clients are blocked.

4.3.2 Parameter description

Parameter	Description
MAC Filters	Used to enable or disable the MAC filters function.
SSID	Lists all the main wireless networks that the router supports. TIP If you unify the SSIDs for 2.4 GHz and 5 GHz bands, the corresponding wireless network only displays one SSID here.
MAC Address Filter	Specifies the three kinds of rules you can perform on the corresponding wireless network. Disable: This function is disabled, and all wireless clients can connect to this wireless network. Only Allow: Only wireless clients with the specified MAC address can connect to this wireless network. Only Forbid: Only wireless clients with the specified MAC address cannot connect to this wireless network.

Parameter	Description	
MAC Filters List	MAC Address	Specifies the MAC address of the client to which the rule applies.
	Remark	(Optional) Specifies the brief description you set for the corresponding MAC address.
	Effective Network	Specifies the wireless network(s) to which the wireless client with this MAC address applies.
	Status	Specifies whether or not the rule is enabled.

4.4 Configure main WiFi advanced settings

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **Wireless > Advanced**.

You can configure the wireless-related advanced settings such as transmit power, network mode, channel and channel bandwidth.

Parameter description

Parameter	Description
2.4GHz Network	Used to enable or disable the 2.4 GHz wireless network of the router.
5GHz Network	Used to enable or disable the 5 GHz wireless network of the router.
Country/Region	Specifies the country or region that you set for the router to conform to the regulations of different countries or regions concerning channels.
Network Mode	Specifies the wireless network mode (also called 802.11 mode, radio mode, or wireless mode) of the router. A proper network mode enables the clients to get the maximum transfer rate and compatibility. Available options for 2.4 GHz band: 11b, 11g, 11b/g, 11b/g/n (default). Available options for 5 GHz band: 11a, 11a/n, 11a/n/ac (default). You are recommended to keep the default settings.
Transmit Power	Specifies the transmit power of this device. A higher value leads to wider WiFi coverage. However, decreasing the value properly increases performance and security of the wireless network.
Channel Bandwidth	Specifies the bandwidth of the working channel. A high channel bandwidth means a higher transmission rate, but the penetration capability is reduced and the transmission distance is shortened. – 20MHz: The router uses the 20MHz channel bandwidth. – 40MHz: The router uses the 40MHz channel bandwidth. – 20MHz/40MHz: This channel bandwidth is available only for the 2.4 GHz. The router automatically adjusts the channel bandwidth to 20MHz or 40MHz based on the surrounding environment. – 80MHz: This channel bandwidth is available only for the 5 GHz. The router uses the 80MHz channel bandwidth.
Channel	Specifies the channel in which the wireless data is transmitted and received. The available channels are determined by the current country/region and wireless band. Automatic: The router automatically detects the occupation rate of channels and selects the appropriate working channel accordingly. If connection drop, freeze or slow internet occurs frequently when you are using the WiFi network, you can try changing the working channel. You can check the channels with low occupation rate and little interference using software tools (such as WiFi analyzer).
RSSI Threshold	Specifies the minimum wireless client signal strength acceptable to the router. A mobile client with signal strength lower than this threshold cannot connect to the router. You can set this parameter to ensure that mobile clients connect to router with strong signal strength.

Parameter	Description
Deployment Mode	Specifies the deployment mode of the router. This parameter is valid only for 2.4 GHz networks. Set this parameter based on the application scenario. The options include: – Coverage-oriented: Applies to scenarios with large area, multiple walls, decentralized users and less than 10 SSIDs in the ambient environment. – Capacity-oriented: Applies to scenarios with intensive users, open and large areas, and more than 25 SSIDs in ambient environment.
Prioritize 5 GHz	Specifies that a wireless client uses the 5 GHz SSID first to connect to the device if the wireless client supports both 5 GHz and 2.4 GHz networks and the networks use the same SSID and password. This parameter is valid only for 5 GHz networks.
Prioritize 5 GHz Threshold	When Prioritize 5 GHz is enabled, if the client signal strength received by the router in 5 GHz is larger than the threshold value, the router allows the client to connect to the 5 GHz for priority; if it is smaller than the value, the router only allows the client to connect to the 2.4 GHz. You are recommended to keep default settings.
Air Interface Scheduling	Specifies whether to enable the air interface scheduling function. This function allows all clients to transmit data for the same duration. If a client transmits data at a low speed and does not finish data transmission within the duration, it can continue transmitting data only in its next data transmission duration. This prevents some slow clients from occupying excessive airtime resources, so as to improve the overall AP efficiency and effectively ensure AP connections for a larger number of clients and greater throughputs.
Short GI	Short guard interval for preventing data block interference. This parameter is valid only for 2.4 GHz networks. Propagation delays may occur on the receiver side due to factors such as multipath wireless signal transmission. If a data block is transmitted at an overly high speed, it may interfere with the previous data block. The short GI helps prevent such interference. Enabling the short GI can yield a 10% improvement in wireless data throughput.
APSD	Specifies whether to enable the Automatic Power Save Delivery (APSD) mode. This parameter is valid only for 5 GHz networks. APSD is a WMM power saving protocol created by Wi-Fi Alliance. Enabling APSD helps reduce power consumption. By default, this mode is disabled.
Client Aging Time	Specifies the maximum period before a WiFi client is disconnected from the router if the client exchanges no data with the router. When data is exchanged within the period, countdown stops.
Mandatory Data Rate	By adjusting the mandatory rate and optional rate, you can limit access from low-speed clients, thus improving the internet experience of other clients.
Supported Data Rate	– Mandatory Rate: It is a group of mandatory rates of the router. Clients must support these mandatory rates; otherwise, the clients will fail to access the WiFi network. – Optional Rate: It is a collection of other rates supported by the router except for mandatory rates. These optional rates help clients realize connection with the router at a higher rate.

5 Authentication

Features available in the router may vary by model and software version. Router availability may also vary by region or ISP. All images, steps, and descriptions in this guide are only examples and may not reflect your actual router experience.

By default, when the router is connected to the internet, the LAN users can access the internet. With the Authentication function enabled, clients connected to the authentication network can access the internet only after successful authentication. If a client is reconnected to the router after successful authentication, the client may be required to perform authentication again.

5.1 Configuration wizard

Procedure	Task	Description
1	Configure authentication portal	Required. Manually create a portal customization.
2	Configure authentication type	Required. Configure one or multiple authentication types based on actual requirements.
3	Configure time policy	Required. Configure the time policy based on actual requirements.
4	Configure guest policies	Required.
5	Configure authentication account	Optional. If the Authentication Type is Account , the authentication account must be configured.
6	Configure authentication-free hosts	Optional. To enable the devices to connect to the internet without authentication, the authentication-free host must be configured.

5.2 Configure authentication portal

5.2.1 Create an image portal

To add an image template:

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **AuthN > Authentication Template > Portal Customization**, and click **Create**.

Parameter description

Parameter	Description
Template Type	Specifies the type of template, including Image Template and Text Template .
Portal Page Name	Specifies the name of the portal page. The name is required.

Parameter	Description
Logo	Specifies the logo image of the portal page. By default, the logo image is Tenda . You can click it to change the logo image.
Title	Specifies the title information of the portal page. By default, the title is Authentication .
Background Image	Specifies the background images of the portal page. You can upload at most three images.  TIP When two or three background images are uploaded, the images will be displayed in turn on the portal page.
Image 1 Link/ Image 2 Link/ Image 3 Link	Specifies the URL linked to the corresponding background image. After the configuration is completed, you can access the website by clicking the corresponding background image on the portal page.  TIP The link must be an http URL, otherwise, the function will not take effect.
Landing Page	Specifies the web address that users are automatically redirected to after passing the authentication. – Original URL: After users pass the authentication, the browser redirects to the website that users visited before the authentication. For example, if the user is visiting Google when being redirected to the portal page, the user will be redirected back to Google after passing the authentication. – Promotional URL: After users pass the authentication, the browser redirects to the address specified here.
Login Delay	Specifies the delay time before login. By default, the delay time is Default (0s) .
Authentication Info Collection	Used to enable or disable the authentication information collection function.
Terms of use	Specifies the disclaimer information on the web portal page. Users must agree and tick the disclaimer before logging in.

5.2.2 Create an text portal

To add a text template:

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **AuthN > Authentication Template > Portal Customization**, and click **Create**.

Parameter description

Parameter	Description
Template Type	Specifies the type of template, including Image Template and Text Template .
Portal Page Name	Specifies the name of the portal page. The name is required.
Logo	Specifies the logo image of the portal page. By default, the logo image is Tenda . You can click it to change the logo image.
Navigation Title	Specifies the title information of the portal page. By default, the title is Authentication .

Parameter	Description
Background Color	Specifies the background color. You can enter an RGB value or select one from the given colors.
Portal Title	Specifies the title of the portal page, including Same as Authentication Type and Customize. – Same as Authentication Type: The name is the same as the authentication type. For example, if this template is used for account authentication, the authentication title will be Account. – Customize: You can customize a portal title here.
Tips Title	Specifies the tip title on the portal page. By default, the title is Tips .
Tips Text	Specifies the tip content on the portal page.
Landing Page	Specifies the web address that users are automatically redirected to after passing the authentication. – Original URL: After users pass the authentication, the browser redirects to the website that users visited before the authentication. For example, if the user is visiting Google when being redirected to the portal page, the user will be redirected back to Google after passing the authentication. – Promotional URL: After users pass the authentication, the browser redirects to the address specified here.
Login Delay	Specifies the delay time before login. By default, the delay time is Default (0s) .
Authentication Info Collection	Used to enable or disable the authentication information collection function.
Terms of use	Specifies the disclaimer information on the web portal page. Users must agree and tick the disclaimer before logging in.

5.3 Configure authentication type

5.3.1 SMS

After the **SMS** authentication is enabled, users need to enter a valid mobile phone number on the portal customization to receive and submit a verification code for authentication. After successful authentication, users can access the internet.

The SMS providers issues the authorization verification code to the specified mobile phone number. Currently, the preset SMS providers include **Tencent Cloud**, **AliCloud**, **Jixintong** and **NEXMO**. Meanwhile, **Customize HTTP Interconnection** is also supported if you want to use other SMS providers.

You need to subscribe to an SMS package from an SMS provider before performing corresponding configurations on the router.

To add an SMS authentication type:

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **AuthN > Authentication Template > Authentication Type**.
3. Click **Add**, and select **SMS** for **Authentication Type**.
4. Set the parameters as required. The following figure is for reference only.

Add Authentication Type

Policy Name

Authentication Type **SMS**

WeChat Privilege Time min ⓘ
The period for which users can use WeChat before authentication. 0 indicates that users are not allowed to use WeChat.

Idle Timeout **No Limit** min ⓘ
If there is no operation within the idle timeout, users need to authenticate again to access the Internet.

Expiration **No Limit** min ⓘ
After the online duration exceeds the authentication validity period, users need to authenticate again to access the Internet.

SMS Provider **Tencent Cloud**

adkappid

Validity Test **Test**
Enter the country/region code and mobile number.
Write an SMS in the following format when using Tencent Cloud. Otherwise, the SMS may fail to be sent:
Hello. Your verification code is {1}. Verify within {2} minutes.

Remark (Optional)

Cancel **Save**

**The interconnection information of different SMS providers is different. When you apply for the SMS packages, you can obtain the corresponding interconnection information and fill it here.*

---End

Parameter description

Parameter	Description
Authentication Type	Specifies the authentication type. Select SMS from the drop-down menu.
WeChat Privilege Time	Specifies the duration for which users can use WeChat before authentication. 0 indicates that users are not allowed to use WeChat before authentication.
Idle Timeout	Specifies the idle timeout of the authentication. If there is no operation within the Idle Timeout after successful authentication, you need to authenticate again to access the internet.
Expiration	Specifies the validity period of authentication. If the internet access expires after successful authentication, you need to re-authenticate to access the internet.
Validity Test	Used to check whether the router is connected to the SMS provider. Enter the mobile phone number and click Test . If the connection is successful, the mobile phone number will receive a message with the verification code.

5.3.2 Email

After the **Email** authentication is enabled, users need to enter an Email address on the portal customization to receive and submit a verification code for authentication. After successful authentication, users can access the internet.

To add an Email authentication type:

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **AuthN > Authentication Template > Authentication Type**.
3. Click **Add**, and select **Email** for **Authentication Type**.
4. Set the parameters as required. The following figure is for reference only.

Parameter description

Parameter	Description
Authentication Type	Specifies the authentication type. Select Email from the drop-down menu.
WeChat Privilege Time	Specifies the duration for which users can use WeChat before authentication. 0 indicates that users are not allowed to use WeChat before authentication.
Idle Timeout	Specifies the idle timeout of the authentication. If there is no operation within the Idle Timeout after successful authentication, you need to authenticate again to access the Internet.
Expiration	Specifies the validity period of authentication. If the internet access expires after successful authentication, you need to re-authenticate to access the internet.
No. of Shared Users	Specifies the number of shared users allowed to access the internet through Email authentication at the same time.
Email	Specify the account and password used to send verification code mails.
Email Password	

Parameter	Description
SMTP Server	Specify the SMTP server address or port.
SMTP Server Port	The Simple Mail Transfer Protocol (SMTP) server is a proxy server for sending mails. The SMTP server addresses and ports of each mail server provider are different, so the user needs to query them by themselves.
Validity Test	Used to check whether the router is connected to the mail server. Enter the Email address and click Test . If the connection is successful, the Email box will receive a verification code.
Email Content	Specifies the content of the verification code Email.

5.3.3 Account

After **Account** is enabled, users need to enter the user name and password on the portal customization. After successful authentication, users can access the internet.

The user name and password must be preconfigured by the network administrator in [Account](#) and distributed to users.

To add an account authentication type:

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **AuthN > Authentication Template > Authentication Type**.
3. Click **Add**, and select **Account** for **Authentication Type**.
4. Set the parameters as required. The following figure is for reference only.

The screenshot shows a web interface for adding an authentication type. The 'Authentication Type' is set to 'Account'. Other settings include 'WeChat Privilege Time' at 0 minutes, 'Idle Timeout' at No Limit, and 'Expiration' at No Limit. The 'Change Password upon First Login' option is set to 'Disable'. A 'Remark' field is also present but optional.

---End

Parameter description

Parameter	Description
Authentication Type	Specifies the authentication type. Select Account from the drop-down menu.
WeChat Privilege Time	Specifies the duration for which users can use WeChat before authentication. 0 indicates that users are not allowed to use WeChat before authentication.
Idle Timeout	Specifies the idle timeout of the authentication. If there is no operation within the Idle Timeout after successful authentication, you need to authenticate again to access the internet.
Expiration	Specifies the validity period of authentication. If the internet access expires after successful authentication, you need to re-authenticate to access the internet.
Change Password upon First Login	Used to enable or disable the change password upon first login function. After this function is enabled, the user needs to change the password to access the internet after the first successful authentication.

5.3.4 No authentication

After **No Authentication** is enabled, users only need to click **Connect** on the pop-up portal customization to access the internet.

To add a one-key authentication type:

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **AuthN > Authentication Template > Authentication Type**.
3. Click **Add**, and select **No authentication** for **Authentication Type**.
4. Set the parameters as required. The following figure is for reference only.

Policy Name

Authentication Type: No Authentication

WeChat Privilege Time: 0 min

The period for which users can use WeChat before authentication. 0 Indicates that users are not allowed to use WeChat.

Idle Timeout: No Limit min

If there is no operation within the idle timeout, users need to authenticate again to access the internet.

Expiration: No Limit min

After the online duration exceeds the authentication validity period, users need to authenticate again to access the internet.

Remark: (Optional)

Cancel Save

---End

Refer to the [parameter description of the account authentication](#) for details.

5.3.5 Random code

After the **Random Code** authentication is enabled, users need to receive and submit a random code on the portal page for authentication. After successful authentication, users can access the internet.

The random codes must be preconfigured by the network administrator in [random code account](#) and distributed to users

To add a random code authentication type:

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **AuthN > Authentication Template > Authentication Type**.
3. Click **Add**, and select **Random Code** for **Authentication Type**.
4. Set the parameters as required. The following figure is for reference only.

Policy Name

Authentication Type: Random Code

WeChat Privilege Time: 0 min

The period for which users can use WeChat before authentication. 0 indicates that users are not allowed to use WeChat.

Idle Timeout: No Limit min

If there is no operation within the idle timeout, users need to authenticate again to access the internet.

Expiration: No Limit min

After the online duration exceeds the authentication validity period, users need to authenticate again to access the internet.

Remark: (Optional)

Parameter description

Parameter	Description
Interface	Specifies the interface that the guest policy is used to.
Portal Customization	Specifies the portal customization of the guest policy. The portal customization should be configured in Portal Customization in advance.
Authentication Type	Specifies the authentication type of the guest policy. The authentication type should be configured in Authentication Type in advance.
Time Policy	Specifies the period during which guest policy takes effect. The time policy should be configured in Time Group in advance.

5.5 Configure authentication account

5.5.1 Configure a user account

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.

Go to **AuthN > Account > Account**. You can add a user account for account authentication to access the internet, and configure the upload or download speed of the user account, the number of shared users. Click **Add** to add a new account.

Button description

Parameter	Description
Add	Used to add an authentication account.
Import	Used to import the account files backed up previously to the local computer.
Export	Used to back up the information of selected accounts to the local computer. The exported file is suffixed with .csv .

Parameter	Description
Delete	Used to delete the selected authentication accounts.
Parameter description	
Parameter	Description
Account Password	Specify the user name and password used for authentication.
Upload Speed Limit/Maximum Upload Speed	Specify the maximum upload and download rate of the account.
Download Speed Limit/Maximum Download Speed	
No. of Shared Users	Specifies the number of users that are allowed to use this account to authenticate and access the internet at the same time.

5.5.2 Configure a random code account

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.

Go to **AuthN > Account > Random Code Account**. You can add a random code account for random code authentication to access the internet. Click **Add** to add a new account.

Button	Description
Add	Used to add a random code.
Print	Used to print some information of the selected random codes with the printer installed on your computer.
Delete	Used to delete the selected authentication-free policies.

Parameter description

Parameter	Description
Random Code	Specifies the random code used for authentication.
Creation Time	Specifies the time when the random code is created.
No. of Created Codes	Specifies the number of random codes to be created.
Account Validity Period	Specifies the validity period of the random code, ranging from 0 to 87600. 0 indicates no limit.
Expired Time	Specifies the time point when the random code expires. Expired accounts cannot be used again. The expiration time point is calculated based on the creation time of the random code and the validity period of the configured account.
Remark	Specifies the description of the random code. The remark is optional.
Traffic Limit	Specifies the total download traffic that the random code is allowed to use. Once this value is exceeded, the random code will be denied internet access.
Available Duration	Specifies the longest duration this random code is allowed to stay online at a time. When the random code expires, the user needs to log in again.

Parameter	Description
No. of Shared Users	Specifies the number of users who are allowed to access the internet using this random code at the same time.
No. of Used	Specifies the number of users who are using the random code to access the internet.
Random Code Title	Specifies the title of the random code. It appears on the central upper part of the page. You can use it for advertising promotion. For example, "Welcome to XX".

5.6 Configure authentication-free hosts

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.

Go to **AuthN > Account > Authentication-free Policy**. You can configure the authentication-free policies for special devices such as network cameras. After configuration, these devices can connect to the internet without authentication.

Parameter description

Parameter	Description
Authentication-free Policy	Specifies the authentication-free policy type of the router, including Terminal Type and Terminal Unique Information .
Authentication-free Condition	Specifies the condition of the authentication-free policy. Only the clients that meet the condition can access the internet without authentication.

Parameter	Description
	When Authentication-free Policy is set to Terminal Unique Information, the following authentication-free conditions are available: – Mobile Number: When SMS authentication is enabled, set mobile numbers that do not require authentication to enable them to access the internet without obtaining verification codes. – IP Address: Devices with the configured IP addresses or group can access the internet without authentication. – MAC Address: Devices with the configured MAC addresses can access the internet without authentication. When Authentication-free Policy is set to Terminal Type, the following authentication-free conditions are available: – Wired Terminals: Devices that are connected to the router in a wired manner can access the internet without authentication. – Wireless Terminals: Devices that are connected to the router in a wireless manner can access the internet without authentication. – Mobile Phone: Devices that are identified as mobile phones can access the internet without authentication.
Authentication-free Content	Specifies the content of the authentication-free policy. When a device meets both the authentication-free condition and content, it can access the internet without authentication. “–” indicates no authentication contents.

5.7 View user list

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.

Go to **AuthN > Account > User List**. You can check and export the authentication user information, kick authenticated accounts offline in batches and delete the authentication information of offline users in batches.

ID	Authentication Type	Authentication Account	Terminal Type	IP Address	MAC Address	Online Time	Online Duration	Status	Remark	Operation
1	Automatic	–	Others	192.168.0.210	08:EA:40:FC:1A:BF	2025-07-22 15:37	58minute(s)	Online	–	Disconnect Delete
2	Authentication-free	–	Mobile Phone	192.168.0.222	C2:19:6E:C7:24:AD	2025-07-22 16:33	2minute(s)	Online	–	Disconnect Delete
3	Authentication-free	–	Mobile Phone	192.168.0.30	02:C0:F1:29:74:F7	2025-07-22 16:35	0minute(s)	Online	–	Disconnect Delete

Button description

Parameter	Description
Export	Used to back up the configuration information of selected users. The exported file is suffixed with .csv .

Parameter	Description
Export All	Used to back up the configuration information of all users. The exported file is suffixed with .csv .
Disconnect	Used to disconnect the selected online users who have authenticated successfully. After being disconnected, an online user that has been authenticated before needs to re-authenticate to access the internet and an authentication-free online user will automatically connect to the internet again.
Delete	Used to delete information of selected offline users.

Parameter description

Parameter	Description
Authentication Type	Specifies the authentication type of the current authenticated user. The user configured as the authentication-free host is displayed as Authentication-free and the user whose guest policy is not configured is displayed as Automatic .
Authentication Account	Specifies the account, Email, mobile phone number, real name or random code used by the user.
Authentication Interface	Specifies the VLAN interface that the guest policy is used.
Terminal Name	Specifies the name of the client.
Terminal Type	Specifies the type of client.
IP Address	Specifies the IP address of the authenticated user.
MAC Address	Specifies the MAC address of the authenticated user.

6 Configure Cloud VPN

Cloud VPN is a service formed by applying Software Defined Network (SDN) technology to WAN scenarios. It can provide wide area interconnection for employees on business trips, branch offices, headquarters and data centers.

Advantages of Cloud VPN:

- Simple networking. One-click interconnection can be realized by the cloud server.
- Permission management. The primary node can configure different access policies for branch nodes, terminal accounts and data centers.
- Unified management. The primary node can manage WiFi and video surveillance on branch nodes in a unified way.

The router only supports **Branch Node** mode, and can receive the policies distributed from both the primary node and the data center.

Configure cloud VPN operating mode:

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Click **Cloud VPN**.
3. Select **Branch Node** from the drop-down list box of **Cloud VPN Mode**.
4. Enter **Cloud VPN Account** of the primary node.
5. Enter **Device Remarks** that can be easily identified.
6. Click **Connect**.

---End

The primary node will receive a join request from the router. After the primary node adds the router to the Cloud VPN, the **Connection Status** will be displayed as **Connected**. The following figure is for reference only.

Parameter description

Parameter	Description
Cloud VPN Mode	Specifies the Cloud VPN mode of the router. Only Branch Node is supported. Branch Node: In this mode, the router is the branch node in the Cloud VPN and can receive the access policies delivered by the primary node and data center. Disable: It specifies that the Cloud VPN function is disabled.
Device SN	Specifies the serial number of the router.
Cloud VPN Acceleration	If enabled, it can improve Cloud VPN performance. However, due to certain compatibility issues in some scenarios, if the Cloud VPN network cannot be used after Cloud VPN acceleration is enabled, it is recommended to disable Cloud VPN acceleration and try again.
Cloud VPN Account	Specify the account used to connect to the Cloud VPN service, that is, the Cloud VPN account of the primary node.
Device Remarks	Specifies the remarks of the router, which facilitate the identification of the primary node.
Traversal Status	Specifies the traversal connection status between the current node and other nodes in the Cloud VPN network.

7 Bandwidth Limit

Features available in the router may vary by model and software version. Router availability may also vary by region or ISP. All images, steps, and descriptions in this guide are only examples and may not reflect your actual router experience.

7.1 Configure WAN bandwidth

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **BW Limit > WAN Bandwidth**.

You can configure the WAN port bandwidth parameters. After you set [multiple WAN ports](#), you can limit the bandwidth of multiple WAN ports respectively.

WAN Bandwidth

Enter the bandwidth provided by the ISP for a better internet access experience.

WAN1 Port	Upload Rate	1000	Mbps	Download Rate	1000	Mbps
-----------	-------------	-----------------------------------	------	---------------	-----------------------------------	------

Save

Parameter description

Parameter	Description
Upload Rate	Specify the bandwidth values of the broadband. If you are not clear about them, consult your ISP
Download Rate	

7.2 Limit bandwidth for specific IP groups

The extranet bandwidth is always limited, so the network administrator needs to control users' network speed to reasonably allocate the limited bandwidth resources, utilizing the extranet resources effectively.

7.2.1 Example of configuring group limit

Networking requirement

An enterprise uses the wireless router to set up a network. The enterprise has the following requirements:

During business hours (08:00 to 18:00 every workday), procurement personnel's computers with IP addresses ranging from 192.168.0.2 to 192.168.0.50 can use a fixed upload and download bandwidth of 1 Mbps. For other clients in the LAN, no bandwidth control rules are added.

Policy name	IP range	Effective time	Upload bandwidth	Download bandwidth
Speed limit	192.168.0.2~50	08:00~18:00 on weekdays	1 Mbps	1 Mbps

Solution

You can use the **Group Limit** function of the router to meet this requirement. Assume that the concurrent sessions of each client is 600.

Configuration procedure

Set a time group

Set an IP group

Set a group limit policy

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Set a time group.
 - 1) Go to **Behavior > Group Policy > Time Group**.
 - 2) Click **Add**, and configure the following time group.

Add Time Group

Policy Name: business weekdays

Time Period 1: 08:00 → 18:00

Time Period 2: Start Time → End Time (Optional)

Time Period 3: Start Time → End Time (Optional)

Cycle: ☐ Every Day
☒ Mon. ☒ Tues. ☒ Wed. ☒ Thur.
☒ Fri. ☐ Sat. ☐ Sun.

Remark: (Optional)

Cancel Save

3. Set an IP group.

- 1) Go to **Behavior > Group Policy > IP Group**.
- 2) Click **Add**, and configure the following IP group.

Add IP Group

Policy Name: procurement

IP Range 1: 192 . 168 . 0 . 2 ~ 192 . 168 . 0 . 50

IP Range 2: . . . ~ . . . (Optional)

IP Range 3: . . . ~ . . . (Optional)

Remark: (Optional)

Cancel Save

4. Set a group limit policy.

- 1) Go to **BW Limit > Group limit**.
- 2) Click **Add**, and configure the following group limit policy.

Add Group Limit Policy

Policy Name: Speed limit

Remark: (Optional)

IP Group: procurement

Time Group: business weekdays

Concurrent Connections: 600 ⓘ

Upload Speed Limit: 128 KB/s ⓘ

Download Speed Limit: 128 KB/s ⓘ

Cancel Save

-----End

Verification

During business hours from 08:00 to 18:00 on weekdays, each computer with an IP address ranging from 192.168.0.2 to 192.168.0.50 is allocated 1 Mbps (128 KB/s) upload and download bandwidth.

7.2.2 Parameter description

Parameter	Description
Policy Name	Specifies the name of the group limit policy.
Remark	Specifies the remark of the group limit policy. The remark is optional.
IP Group	Specifies the IP address group upon which the group speed limit policy takes effect. The group speed limit policy takes effect only when the device IP addresses are in the IP address group.  TIP The IP group should be configured in IP Group in advance.
Time Group	Specifies the time group upon which the group speed limit policy takes effect. The group speed limit policy takes effect only in such configured time.  TIP The time group should be configured in Time Group in advance.
Concurrent Connections	Specifies the maximum connections for a single user device in the controlled IP group.  TIP 0 indicates no limit.
Upload Speed Limit	Specify the maximum upload/download rate of the controlled user device. The bandwidth obtained by each controlled device may be different.
Download Speed Limit	 TIP 0 indicates no limit.

8 Behavior

Features available in the router may vary by model and software version. Router availability may also vary by region or ISP. All images, steps, and descriptions in this guide are only examples and may not reflect your actual router experience.

8.1 Group policy

8.1.1 Configure a time group

The time group policy is used to divide time into different groups and combine different groups together randomly.

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **Behavior > Group Policy > Time Group**.

You can configure the time group policy according to the actual requirements. Click **Add** to add a new time group.

Time Group ⓘ

Add

Policy Name	Time Period	Cycle	Remark	Operation

↓

Add Time Group ✕

Policy Name

Time Period 1 ⓘ

Time Period 2 ⓘ (Optional)

Time Period 3 ⓘ (Optional)

Cycle ☐ Every Day
☐ Mon. ☐ Tues. ☐ Wed. ☐ Thur.
☐ Fri. ☐ Sat. ☐ Sun.

Remark (Optional)

Parameter description

Parameter	Description
Policy Name	Specifies the name of the time group policy.
Time Period	Specifies the time periods included in the time group. One policy supports at most 3 time periods, and the time periods cannot be repeated.
Cycle	Specifies the cycle upon which the time group policy takes effect.
Remark	Specifies the remark of the policy.

8.1.2 Configure an IP group

The IP group policy is used to set the hosts within the LAN into different groups based on their IP addresses.

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **Behavior > Group Policy > IP Group**.

You can configure the IP group policy according to the actual requirements. Click **Add** to add a new IP group.

The screenshot shows the 'IP Group' configuration page. At the top, there is a table with the following columns: Policy Name, IP Address Range, Remark, and Operation. The table currently displays 'No Data'. A blue 'Add' button is located to the left of the table. A red dashed box highlights this button. A blue arrow points from the 'Add' button to the 'Add IP Group' dialog box. The dialog box contains the following fields: Policy Name, IP Range 1, IP Range 2 (Optional), IP Range 3 (Optional), and Remark (Optional). At the bottom right of the dialog box, there are 'Cancel' and 'Save' buttons.

Parameter description

Parameter	Description
Policy Name	Specifies the name of the IP group policy.

Parameter	Description
IP Address Range	Specifies the IP address ranges included in the IP group. One policy supports at most 3 IP address ranges, and the IP address ranges cannot be repeated.
Remark	Specifies the remark of the IP group policy.

8.2 Allow or block internet access for devices

You can configure the IP address filtering rules to allow or block the LAN hosts to connect to the router for internet.

8.2.1 Example of configuring an IP address filtering policy

Networking requirement

An enterprise uses the wireless router to build a network.

Requirement:

During business hours (08:00 to 18:00 on weekdays), only purchasers are allowed to access the internet.

Solution

The IP address filtering can meet this requirement.

Assume that the IP addresses of the purchasers' computers range from 192.168.0.2 to 192.168.0.10.

Configuration procedure

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Set a time group.
 - 1) Go to **Behavior > Group Policy > Time Group**.
 - 2) Click **Add**, and configure the following time group.

Add Time Group [X]

Policy Name:

Time Period 1: → [Clock icon]

Time Period 2: → [Clock icon] (Optional)

Time Period 3: → [Clock icon] (Optional)

Cycle: ☐ Every Day

☒ Mon. ☒ Tues. ☒ Wed. ☒ Thur.

☒ Fri. ☐ Sat. ☐ Sun.

Remark: (Optional)

[Cancel] [Save]

3. Set an IP group.

- 1) Go to **Behavior > Group Policy > IP Group**.
- 2) Click **Add**, and configure the following IP group.

Add IP Group [X]

Policy Name:

IP Range 1: . . . ~ . . .

IP Range 2: . . ~ . . (Optional)

IP Range 3: . . ~ . . (Optional)

Remark: (Optional)

[Cancel] [Save]

4. Add an IP filtering policy.

- 1) Go to **Behavior > Filtering > IP Address Filtering**.
- 2) Click **Add**, and configure the following IP filtering policy.

Add IP Filtering Policy

Filtering Policy: White List (Allowed to access) ▾

IP Address Policy: ☐ IP Address ☒ IP Address Group

IP Group: purchasers ▾

Time Group: business weekdays ▾

Remark: (Optional)

Add		Delete		Search		
☐ Filtering Policy	IP Address Policy	IP Address or IP Address Group	Time Group	Remark	Status ↓	Operation
☐ White List (Allowed to access the internet)	IP Address Group	purchasers	business weekdays	-	Enabled	Edit Disable Delete
☐ It allows hosts or devices not in the list to access the internet.						

-----End

Verification

During 08:00 to 18:00 on weekdays, only the purchasers' computers with IP addresses ranging from 192.168.0.2 to 192.168.0.10 can access the internet.

8.2.2 Parameter description

Parameter	Description
Filtering Policy	Specifies the mode of the IP address filtering policy. Blacklist (Blocked to access the internet): The user with the specified IP address is blocked to access the internet during the specified time period, and is allowed to access the internet during other time. White List (Allowed to access the internet): The user with the specified IP address is allowed to access the internet during the specified time period, and is blocked to access the internet during other time.
IP Address Policy	To filter one IP address, select IP Address and enter the IP address.
IP Address or IP Group	To filter one or more IP address groups, select IP Address Group and select the corresponding IP group policy you set.

Parameter	Description
	 TIP The IP group should be configured in IP Group in advance.
Time Group	Used to select the time group policy upon which the IP address filtering policy takes effect.  TIP The time group should be configured in Time Group in advance.
Remark	Specifies the remark of the IP address filtering policy.
Status	Specifies the status of the IP address filtering policy, including Enabled and Disabled .
It allows hosts or devices not in the list to access the internet.	– When Selected: The devices not in the filtering list or devices with the filtering policy disabled can access the internet. – When Deselected: The devices not in the filtering list or devices with the filtering policy disabled cannot access the internet.  TIP To deselect this function, configure a whitelist first.

8.3 Restrict Internet Service Types by Port

Application protocols for internet services have specific port numbers. 0 to 1023 are port numbers for some common services. These ports are generally fixed to specific services.

Using Port Address Filtering, you can control users' access to certain types of internet services by blocking specified service ports.

8.3.1 Example of configuring a port filtering policy

Networking requirement

An enterprise uses the wireless router to build a network.

Requirement:

During business hours (08:00 to 18:00 on weekdays), webpage browsing is forbidden for finance department staff (The default port number of the webpage browsing service is 80).

Solution

The port filtering can meet this requirement.

Assume that the IP addresses of the finance department staff range from 192.168.0.2 to 192.168.0.10.

Configuration procedure

Set a time group

Set an IP group

Add port filtering policy

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Set a time group.
 - 1) Go to **Behavior > Group Policy > Time Group**.
 - 2) Click **Add**, and configure the following time group.

The screenshot shows the 'Add Time Group' configuration window. It contains the following fields and options:

- Policy Name:** A text input field containing 'business weekdays'.
- Time Period 1:** A time range selector showing '08:00' to '18:00' with a clock icon.
- Time Period 2:** A time range selector showing 'Start Time' to 'End Time' with a clock icon, labeled '(Optional)'.
- Time Period 3:** A time range selector showing 'Start Time' to 'End Time' with a clock icon, labeled '(Optional)'.
- Cycle:** A section with a 'Every Day' checkbox and seven day checkboxes: Mon. (checked), Tues. (checked), Wed. (checked), Thur. (checked), Fri. (checked), Sat. (unchecked), and Sun. (unchecked).
- Remark:** A text input field, labeled '(Optional)'.
- Buttons:** 'Cancel' and 'Save' buttons at the bottom right.

3. Set an IP group.
 - 1) Go to **Behavior > Group Policy > IP Group**.
 - 2) Click **Add**, and configure the following IP group.

Add IP Group

Policy Name:

IP Range 1: ~

IP Range 2: ~ (Optional)

IP Range 3: ~ (Optional)

Remark: (Optional)

4. Add a port filtering policy.

- 1) Go to **Behavior > Filtering > Port Filtering**.
- 2) Click **Add**, and configure the following port filtering policy.

Add Port Filtering Policy

-----End

Verification

During 08:00 to 18:00 on weekdays, in the LAN network, the computers with IP addresses ranging from 192.168.0.2 to 192.168.0.10 cannot browse web pages.

8.3.2 Parameter description

Parameter	Description
IP Group	Used to select the IP address group policy upon which the port filtering policy takes effect.  TIP The IP address group should be configured in IP Group in advance.
Time Group	Used to select the time group policy upon which the port filtering policy takes effect.  TIP The time group should be configured in Time Group in advance.
Port	Specifies the service port forbidden to access.
Protocol	Specifies the service protocol forbidden to access.
Remark	Specifies the remark of the port filtering policy.

8.4 Allow or block URL access for devices

The URL filtering prevents LAN users from accessing specified types of website and controls internet accessibility of LAN users so that they will not spend time on websites irrelevant to their duties.

8.4.1 Example of configuring a URL filter rule

Networking requirement

An enterprise uses the wireless router to build a network.

Requirement:

During business hours (08:00 to 18:00 on weekdays), designing department staff are disallowed to access social media like Facebook and Tumblr.

Solution

The URL filtering can meet this requirement.

Assume that the IP addresses of the designing department staff's computers range from 192.168.0.2 to 192.168.0.10.

Configuration procedure

Set a time group

Set an IP group

Add a URL filtering policy

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Set a time group.
 - 1) Go to **Behavior > Group Policy > Time Group**.
 - 2) Click **Add**, and configure the following time group.

The 'Add Time Group' window contains the following fields and options:

- Policy Name:** A text input field containing 'business weekdays'.
- Time Period 1:** A time range selector showing '08:00' to '18:00' with a clock icon.
- Time Period 2:** A time range selector showing 'Start Time' to 'End Time' with a clock icon, labeled '(Optional)'.
- Time Period 3:** A time range selector showing 'Start Time' to 'End Time' with a clock icon, labeled '(Optional)'.
- Cycle:** A section with a radio button for 'Every Day' and checkboxes for days of the week: Mon. (checked), Tues. (checked), Wed. (checked), Thur. (checked), Fri. (checked), Sat. (unchecked), and Sun. (unchecked).
- Remark:** A text input field labeled '(Optional)'.
- Buttons:** 'Cancel' and 'Save' buttons at the bottom right.

3. Set an IP group.
 - 1) Go to **Behavior > Group Policy > IP Group**.
 - 2) Click **Add**, and configure the following IP group.

The 'Add IP Group' window contains the following fields and options:

- Policy Name:** A text input field containing 'purchasers'.
- IP Range 1:** Two IP address input fields separated by a tilde (~). The first field contains '192 . 168 . 0 . 2' and the second contains '192 . 168 . 0 . 10'.
- IP Range 2:** Two IP address input fields separated by a tilde (~), labeled '(Optional)'.
- IP Range 3:** Two IP address input fields separated by a tilde (~), labeled '(Optional)'.
- Remark:** A text input field labeled '(Optional)'.
- Buttons:** 'Cancel' and 'Save' buttons at the bottom right.

4. Add a URL filtering policy.

- 1) Go to **Behavior > Filtering > URL Filtering**.
- 2) Click **Add**, and configure the following URL filtering policy.

-----End

Verification

During 08:00 to 18:00 on weekdays, clients with the IP addresses ranging from 192.168.0.2 to 192.168.0.10 cannot access Facebook and Tumblr.

8.4.2 Parameter description

Parameter	Description
Filtering Policy	Specifies the mode of the URL filtering policy. – Blacklist (Blocked to access the internet): The user with the specified IP address is only blocked to access specified websites during the specified time period, and is allowed to access all websites during other time. – White List (Allowed to access the internet): The user with the specified IP address is only allowed to access specified websites during the specified time period, and is allowed to access all websites during other time.
IP Address Policy	To filter one IP address, select IP Address and enter the IP address.
IP Address or IP Address Group	To filter one or more IP address groups, select IP Address Group and select the corresponding IP group policy you set.  TIP The IP group should be configured in IP Group in advance.

Parameter	Description
Time Group	Used to select the time group policy upon which the URL filtering policy takes effect.  TIP The time group should be configured in Time Group in advance.
URL Keywords	Specifies the keywords of the URL forbidden/allowed to access.
Remark	Specifies the remark of the URL filtering policy.
It allows hosts or devices not in the list to access the internet.	- When Selected: The devices not in the filtering list or devices with the filtering policy disabled can access the specified websites. - When Deselected: The devices not in the filtering list or devices with the filtering policy disabled cannot access the specified websites.  TIP To deselect this function, configure a whitelist first.

8.5 Block the user to Ping target IP

When a Ping filter rule is added, the device with specified source IP address cannot ping the target IP address.

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **Behavior > Ping Filter**.
3. Click **Add**.
4. On the **Add** configuration window, enter the **IP Address** of a device to which the rule applies to, enter the **Target IP** to block ping requests, and enter the **Remark** of the rule.

- To filter one device with specified IP address, set **Source address policy** to **IP Address** and enter the IP address.
- To filter devices within an IP address group, set **Source address policy** to **IP Address Group** and select the corresponding IP group policy you set. The IP group should be configured in [IP Group](#) in advance.

5. Click **Save**.

9 More settings

Features available in the router may vary by model and software version. Router availability may also vary by region or ISP. All images, steps, and descriptions in this guide are only examples and may not reflect your actual router experience.

9.1 Advanced routing

9.1.1 Modify WAN parameters

If you have completed the [Internet settings](#) correctly, but users of the router's LAN still cannot access the internet, or there is a problem with the internet, you can try to modify the WAN parameters to solve the problem.

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **More > Advanced Routing > WAN Parameters**.

You can click **Edit** to modify the WAN parameters. After you set [multiple WAN ports](#), you can modify the parameters of multiple WAN ports respectively.

The image shows two screenshots from a router's web interface. The top screenshot is the 'WAN Parameters' page, which contains a table with columns: WAN Port, Rate, MTU, MAC Address, Operating Mode, and Operation. The table has one row for 'WAN1' with values: 1000 Mbps Full Duplex (Auto Negotiation), 1500, [redacted], Default MAC Address, Internet, and an 'Edit' link. Below the table is a pagination bar showing '1 items in total' and a dropdown for '10'. A blue arrow points from the 'Edit' link to the bottom screenshot. The bottom screenshot is a dialog box titled 'Edit WAN1 Port Parameters'. It contains several configuration fields: 'Rate' (Auto Negotiation), 'MTU' (1500), 'MAC Address' (Default MAC Address), 'Operating Mode' (Internet), 'WAN Link Detection' (radio buttons for Enable and Disable, with 'Enable' selected), 'Detect Web Address' (www.baidu.com), 'Detection Interval' (10 s), and 'Detection Quantity' (1). At the bottom of the dialog are 'Cancel' and 'Save' buttons.

WAN Port	Rate	MTU	MAC Address	Operating Mode	Operation
WAN1	1000 Mbps Full Duplex (Auto Negotiation)	1500	[redacted] Default MAC Address	Internet	Edit

1 items in total < 1 > 10

↓

Edit WAN1 Port Parameters

Rate: Auto Negotiation

MTU: 1500

MAC Address: Default MAC Address

Operating Mode: Internet

WAN Link Detection: ☒ Enable ☐ Disable

Detect Web Address: www.baidu.com

Detection Interval: 10 s

Detection Quantity: 1

Cancel Save

Parameter description

Parameter	Description
WAN Port	Specifies the WAN port of the router.
Rate	Specifies the rate and duplex mode of the WAN port, which must be consistent with the rate and duplex mode of the WAN port at the peer side. Otherwise, the WAN port may fail to transmit and receive data normally. Generally, it is recommended to keep the default Auto Negotiation setting. If the router's WAN port is connected normally but the corresponding interface light is not on, first check whether the Ethernet cable or port is damaged. Other settings should only be used if the rate and duplex mode of the peer device are known and auto-negotiation has failed.
MTU	Maximum Transmission Unit (MTU) is the largest data packet that a network device transmits, and is related to the WAN port's connection type. Generally, keep the default value. If you cannot access some websites or cannot send and receive emails, you can try to modify the MTU value. The recommended modification range is 1400 to 1500. The following are scenarios where commonly used MTU apply: – 1500: Used for the most common settings in non-PPPoE connections and non-VPN connections. – 1492: Used for PPPoE connections. – 1480: It is the maximum value for the Ping function (packets larger than this value will be broken down). – 1450: Used for DHCP, which assigns dynamic IP addresses to connected devices. – 1400: Used for VPN or PPTP.
MAC Address	Specifies the MAC address of the WAN port, which can be customized. After the networking is set up, if the router still cannot connect to the internet, the ISP may have bound the account to a certain MAC address. You can try to solve the problem by modifying the MAC address of the WAN port. – Default MAC Address: The default value can be changed if the MAC address is set to Customize. – Customize: You can customize the MAC address as required.
Operating Mode	Specifies the working mode of the WAN port. – Internet: This mode is used as a normal WAN port to connect to the internet. – Local Network: The WAN port cannot forward DNS requests, which means that the internet cannot be accessed. This mode is usually used for enterprise intranet.
WAN Link Detection	When the WAN Link Detection function is enabled, the router periodically detects the connectivity between WAN Port and Detect Web Address, and then selects the best WAN port link as the main egress link according to the detection results.

Parameter	Description
Detect Web Address	Specifies the domain name that needs to be detected, for example, www.baidu.com.  When the WAN Link Detection function is enabled, Detect Web Address can be configured.
Detection Interval	Specifies the interval to perform detections.  When the WAN Link Detection function is enabled, Detection Interval can be configured.
Detection Quantity	Specifies the quantity of the detections.  When the WAN Link Detection function is enabled, Detection Interval can be configured.

9.1.2 Configure multi-WAN policy

Overview

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **More > Advanced Routing > Multi-WAN Policy**.

You can configure the multi-WAN policy and E-bank data based on source in&out.

- **Multi-WAN policy**

After the router enables multiple WAN ports, it can allow multiple broadband access at the same time to achieve bandwidth superposition. When multiple WAN ports are working at the same time, setting a reasonable multi-WAN policy can greatly improve the bandwidth utilization of the router.

- **Intelligent Load Balancing:** It indicates that data traffic is allocated automatically and the system will use the WAN port with the least traffic for communication automatically.
- **Customize:** Users can designate a WAN port for forwarding traffic of a source IP address according to actual needs.

- **E-bank data based on source in&out**

When this function is enabled, the transmitting port and receiving port of E-bank traffic must be consistent, and this configuration is not affected by the load balancing policy. When this function is disabled, some E-banks cannot be used normally.

By default, the router's multi-WAN policy is **Intelligent Load Balancing**. When **Customize** is selected, the page is as follows.

Multi-WAN Policy

Multi-WAN Policy
Intelligent Load Balancing

Parameter description

Parameter	Description
IP Group	Specifies the IP group of the multi-WAN policy. Data traffic from this IP group which can only be forwarded through the specified WAN port. Only one rule can be configured for an IP group. You can configure the IP group in IP Group .
WAN Port	Specifies the WAN port of the multi-WAN policy. Data traffic from the specified IP group will only be forwarded through this WAN port.
Remark	Specifies the description of the multi-WAN policy.

Example of configuring multi-WAN policy

Networking requirements

An enterprise uses the wireless router to set up a network. To meet the requirements of the enterprise network, two broadband lines have been handled and the internet has been successfully accessed.

To achieve load balancing, the enterprise has the following requirements:

- Computers with IP addresses 192.168.0.2 to 192.168.0.100 access the internet through Broadband A.
- Computers with IP addresses 192.168.0.101 to 192.168.0.250 access the internet through Broadband B.

Solution

You can use the multi-WAN policy function of the router to meet this requirement.

Configuration procedure

Set an IP group

Enable the multi-WAN policy function

Customize the multi-WAN policy

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Set an IP group.

Go to **Behavior > Group Policy > IP Group**, and click **Add** to configure the following two IP groups.

IP Group			
Add			
Policy Name	IP Address Range	Remark	Operation
IP Group 1	192.168.0.2~192.168.0.100	-	Edit Delete
IP Group 2	192.168.0.101~192.168.0.250	-	Edit Delete

3. Enable the multi-WAN policy function.
 - 1) Go to **More > Advanced Routing > Multi-WAN Policy**.
 - 2) Select **Customize** for **Multi-WAN Policy**.
 - 3) Confirm the prompt information, and click **OK**.

Multi-WAN Policy

Multi-WAN Policy ☐ Intelligent Load Balancing ☒ Customize

[Add](#)

IP Group	WAN Port	Remark	Status ↓	Operation
No Data				

4. Customize the multi-WAN policy.

Go to **More > Advanced Routing > Multi-WAN Policy**, and click **Add** to configure the following two multi-WAN policies.

Multi-WAN Policy

Multi-WAN Policy ☐ Intelligent Load Balancing ☒ Customize

[Add](#)

IP Group	WAN Port	Remark	Status ↓	Operation
IP Group 2	WAN2	-	Enabled	Edit Disable Delete
IP Group 1	WAN1	-	Enabled	Edit Disable Delete

-----End

Verification

When a device in the LAN with an IP address in the range of 192.168.0.2 to 192.168.0.100 accesses the internet, the data traffic is forwarded by the WAN1 port. When a device in the LAN with an IP address in the range of 192.168.0.101 to 192.168.0.250 accesses the internet, the data traffic is forwarded by the WAN2 port.

9.1.3 Configure static routing

Routing is an operation to choose an optimum path to convey data from the source address to the target address. A static route is a manually configured special route and is simpler, more efficient, and more reliable. An appropriate static route can reduce issues arising from route selection and ease the overflow of route selection data flow, improving the rate of data packet forwarding.

You can specify a static route by setting **Target Network**, **Subnet Mask**, **Default Gateway** and **Interface**. Among these parameters, **Target Network** and **Subnet Mask** are used to specify a target network or host. After the static route is configured successfully, all the data whose target address is

in the target network of the static routing is directly forwarded to the gateway address through the interface of the static route.

- If static routes are completely used in a large-scale and complicated network, route unavailability and network interruption may occur in case of network fault or topology change. Under such circumstances, the network administrator needs to manually change the static routing configurations.
- When a static routing policy conflicts with a customized multi-WAN policy, static routing takes precedence.

Example of configuring static routing

Networking requirements

An enterprise uses the wireless router to set up a network. The WAN1 port has been connected to the internet through PPPoE. Now the enterprise has set up an intranet, which is in a different network from the internet. The WAN2 port is connected to the enterprise's intranet through dynamic IP address.

The enterprise has the following requirements: LAN users can access both the internet and the intranet.

Solution

You can use the Static Routing function to meet the requirements.

Configuration procedure

Enable two WAN ports and connect WAN2 port to the internet

Configure the static routing

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Enable two WAN ports and connect WAN2 port to the internet.
 - 1) Go to **Network > Internet Settings**.
 - 2) Set **No. of WAN Ports** to **2**.
 - 3) Confirm the prompt information and click **OK**. The router will reboot.

Wait until the router complete rebooting. Click **Network > Connection Status**.

No. of WAN Ports

Interface: **Gigabit Ethernet Port**

No. of WAN Ports: **2**

Port Status:

1	2	3	4
WAN	WAN/LAN	WAN/LAN	LAN
WAN 1	WAN 2	LAN 3	LAN 4

- 4) Under **WAN2**, select **Dynamic IP Address** for **Connection Type**, and click **Connect**.

When the **Status** is **Connected**, the WAN2 port is successfully connected to the network.

WAN 1 **WAN 2**

Connection Settings

ISP Type: **Normal**

Connection Type: **Dynamic IP Address**

Primary DNS: . . . (Optional)

Secondary DNS: . . . (Optional)

Status: **Connected**

Connect **Disconnect**

3. Configure the static routing.
 - 1) Obtain the IP address information of the WAN2 port.

Click **System**, click the drop-down box next to [WAN Real-time Rate](#) to select **WAN2**, and view the IP address information obtained by WAN2 under **Connection Status**, assuming the following:

WAN2 IP Address	Subnet Mask	Default Gateway	Primary DNS
192.168.98.190	255.255.255.0	192.168.98.1	192.168.98.1

2) Configure parameters of the static routing.

The following table lists the static routing parameters for example:

Policy Name	Target Network	Subnet Mask	Default Gateway	Interface
Intranet Access	172.16.100.0	255.255.255.0	192.168.98.1	WAN2

Go to **More > Advanced Routing > Static Routing**, click **Add** to configure parameters in the **Add Static Routing** window, and click **Save**.

-----End

Added successfully. See the following figure.

Policy Name	Target Network	Subnet Mask	Default Gateway	Interface	Status ↑	Operation
Intranet Access	172.16.100.0	255.255.255.0	192.168.98.1	WAN2	Enabled	Edit Disable Delete

Verification

LAN users can access both the internet and the intranet.

Parameter description

Parameter	Description
Policy Name	Specifies the name of the static routing policy.
Target Network	Specifies the IP address of the target network. 0.0.0.0 target network and 0.0.0.0 subnet mask indicate the default route.  TIP If no accurate route is found in the route table, the router chooses the default route to forward data packets.
Subnet Mask	Specifies the subnet mask of the target network.
Default Gateway	Specifies the ingress port IP address of the next hop route after data packets egress from the router. 0.0.0.0 indicates direct routing, which means that the target network is directly connected to the interface of the router.
Interface	Specifies the interface from which packets egress. Select it as required.

9.1.4 View routing table

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **More > Advanced Routing > Routing Table**.

You can view the detailed routing information of the router.

Routing Table 			
Target Network	Subnet Mask	Default Gateway	Interface
0.0.0.0	0.0.0.0	172.16.200.1	WAN1
172.16.200.1	255.255.255.255	0.0.0.0	WAN1
192.168.0.0	255.255.255.0	0.0.0.0	LAN
192.168.96.0	255.255.255.0	0.0.0.0	WAN2

Parameter description

Parameter	Description
Target Network	Specifies the IP address of the destination network. If both the destination network and subnet mask are 0.0.0.0, it is the default route.  TIP When a route that exactly matches the destination address of the packet cannot be found in the routing table, the router will select the default route to forward the packet.

Parameter	Description
Subnet Mask	Specifies the subnet mask of the destination network.
Default Gateway	Specifies the ingress IP address of the next hop router of data packets. The default gateway is 0.0.0.0, which means direct routing, that is, the destination network is the network directly connected to the interface of the router.
Interface	Specifies the interface of the router that data packets are forwarded.

9.1.5 Configure policy routing

Policy routing, also known as policy-based routing, means that the next hop forwarding address of an IP packet is determined by a comprehensive consideration of multiple factors, rather than the destination or source IP address. You can set the source network, target network, destination port, protocol and WAN port with the policy routing for more accurate route selection.

With this function enabled, the router will forward the data packets that meet the policy conditions to the specified target network through the specified WAN port.

Example of configuring policy routing

Networking requirements

An enterprise uses the wireless router to set up a network. The router is connected to the internet through PPPoE. The enterprise has built a Web server on the intranet, which is in a different network from the internet. The access mode of the enterprise's intranet is dynamic IP address.

The enterprise has the following requirements: Users whose LAN addresses are 192.168.0.2 to 192.168.0.254 can access both the internet and the Web server of the enterprise's intranet (the port number is 9999).

Solution

You can use the Policy Routing function to meet the requirements.

Configuration procedure

Enable two WAN ports and connect WAN2 port to the internet

Configure the policy routing

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. [Enable two WAN ports and connect WAN2 port to the internet.](#)
3. Configure the policy routing.

The following table provides the examples of policy routing parameters.

Policy Name	Source IP Address Range/Mask	Source Port	Destination IP Address Range/Mask	Destination Port	Protocol	Interface	Metric
Web Server Access	192.168.0.0/24	1–65535	172.16.100.0/24	1–65535	ALL	WAN2	10

Go to **More > Advanced Routing > Policy Routing**, click **Add** to configure parameters in the **Add Policy Routing** window, and click **Save**.

Add Policy Routing

Policy Name

The policy routing is added successfully.

Policy Routing									
Add									
Policy Name	Source IP Address Range/Mask	Source Port	Destination IP Address Range/Mask	Destination Port	Protocol	Interface	Metric	Status	Operation
Web Server Access	192.168.0.0/24	1-65535	172.16.100.0/24	1-65535	ALL	WAN2	10	Enabled	Edit Disable Delete

Verification

Users whose LAN addresses ranging from 192.168.0.2 to 192.168.0.254 can access both the internet and the intranet.

Parameter description

Parameter	Description
Policy Name	Specifies the name of the policy routing rule.
Source IP Address Range/Mask	Specifies the source IP address range of data packets.
Source Port	Specifies the source port of data packets.
Destination IP Address Range/Mask	Specifies the destination IP address range to which data packets are forwarded.
Destination Port	Specifies the port of the device to which data packets are forwarded, which ranges from 1 to 65535.

Parameter	Description
Protocol	Specifies the protocol type of data packets. – ALL: If you are not sure about the protocol type, ALL is recommended. – TCP: Transmission Control Protocol is a common protocol that provides reliable data transmission. – UDP: User Datagram Protocol is a simple packet-oriented communication protocol.
Interface	Specifies the physical port for which the policy takes effect. Data packets that meet the conditions of the policy routing will be forwarded through this port.
Metric	Specifies the metric of the policy. A smaller metric indicates a higher priority for policy routing. The metric value ranges from 1 to 9999.
Status	Specifies the status of the policy routing rule, including Enabled , Disabled and Expired .

9.2 Virtual service

9.2.1 Configure DMZ

After a device in the LAN is set as the DMZ host, the device enjoys no limitations when communicating with the internet. For example, if video meeting or online games are underway on a computer, you can set that computer as the DMZ host to make the video meeting and online games go smoother.

- After you set a LAN device as a DMZ host, the device will be completely exposed to the internet and the firewall of the router does not take effect on the device.
- Hackers may attack on the local network by using the DMZ host. Exercise caution to use the DMZ function.
- The security guard, anti-virus software and system firewall on the DMZ host may affect the DMZ function. Disable them when using this function. When you are not using the DMZ function, you are recommended to disable the function and enable the firewall, security guard and anti-virus software on the DMZ host.

Example of configuring DMZ

Networking requirements

An enterprise uses the wireless router to set up a network. The router has connected to the internet and can offer internet service for LAN users. The enterprise has the following requirements:

The intranet web server is open to internet users to enable staff to access the intranet even when they are not in the enterprise.

Solution

- You can use the DMZ function to enable internet users to access the intranet web server.
- You can use the DHCP Reservation function to avoid access failures caused by web server address change.

Assume that the information of the web server is shown as below:

- IP address of the web server: 192.168.0.250
- MAC address of the host that runs the web server: C8:9C:DC:60:54:69
- Service port: 9999

- Before the configuration, ensure that the WAN port of the router obtains a public IP address. If the WAN port obtains a private IP address or an intranet IP address assigned by the ISP, the DMZ function may not take effect. Common IPv4 addresses are classified into class A, class B and class C. Private IP addresses of class A range from 10.0.0.0 to 10.255.255.255. Private IP addresses of class B range from 172.16.0.0 to 172.31.255.255. Private IP addresses of class C range from 192.168.0.0 to 192.168.255.255.
- ISPs may not support unreported web service accessed using the default port number 80. Therefore, when setting DMZ host, you are recommended to set the external port as a non-familiar port (1024 to 65535), such as 9999, to ensure normal access.

Configuration procedure

Set the DMZ host

Reserve a fixed IP address for the DMZ host

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Set the DMZ host.
 - 1) Go to **More > Virtual Service > DMZ**.
 - 2) Locate the corresponding WAN port, and click **Edit**.

DMZ			
Interface	DMZ Host IP Address	Status ↓	Operation
WAN1	-	Disabled	Edit Enable

- 3) Set **DMZ Host IP Address** (the IP address of the LAN device to be set as the DMZ host), which is **192.168.0.250** in this example.
- 4) Click **Save**.

Edit WAN1 DMZ

Interface

WAN1

DMZ Host IP Address

192 . 168 . 0 . 250

Cancel

Save

- 5) Click **Enable**.

DMZ			
Interface	DMZ Host IP Address	Status ↓	Operation
WAN1	192.168.0.250	Disabled	Edit Enable

3. Reserve a fixed IP address for the DMZ host.
 - 1) Go to **Network > DHCP Reservation**, and click **Add**.

DHCP Reservation						
Add Delete Import Export Search						
☐	Terminal Name	Terminal Type	IP Address ↑	MAC Address	Remark	Status
Operation						

2) Set the following rules, and click **Save**.

- Set **Terminal Name**, which is **Web Server** in this example.
- Set **IP Address** to the fixed IP address assigned to the server host, which is **192.168.0.250** in this example.
- Set **MAC Address** of the server host, which is **C8:9C:DC:60:54:69** in this example.
- Set **Remark**, which is **Web Server Address** in this example.

The screenshot shows a window titled "Add DHCP Reservation". Inside, there are four labeled input fields: "Terminal Name" (containing "Web Server"), "IP Address" (containing "192 . 168 . 0 . 250"), "MAC Address" (containing "C8:9C:DC:60:54:69"), and "Remark" (containing "Web Server Address" with a "(Optional)" label to its right). At the bottom right of the window are two buttons: "Cancel" and "Save".

-----End

Verification

Internet users can successfully access the intranet server by using the **Intranet service application layer protocol name://WAN port IP address**. If the intranet service port is not the default port number, the access address is **Intranet service application layer protocol name://WAN port IP address:Intranet service port**.

In this example, the access address is **http://202.105.11.22:9999**.

You can find the router's current WAN port IP address in [Connection Status](#).

If [DDNS](#) is enabled on the WAN port, internet users can also access the intranet server by using **Intranet service application layer protocol name://WAN port domain name: Intranet service port**.

Parameter description

Parameter	Description
Interface	Specifies the port whose DMZ service will be enabled. The default port is WAN1.
DMZ Host IP Address	Specifies the IP address of the device to be set as a DMZ host within the LAN.

9.2.2 Configure DDNS

DDNS is abbreviated for Dynamic Domain Name Service. When a service is running, the DDNS client sends the IP address of the current WAN port of the router to the DDNS server, and the server updates the mapping relationships between the domain name and IP address in the database, achieving dynamic domain name resolution.

Using DDNS, you can map the dynamic WAN IP address of the router (public IP address) to a fixed domain name. The DDNS function is generally used with such functions as port mapping and DMZ host to enable internet users to access the LAN server or the web UI of the router through a domain name without caring about the change of the WAN IP address.

Example of configuring DDNS

Networking requirements

An enterprise uses the wireless router to set up a network. The router has connected to the internet and can offer internet service for LAN users. The enterprise has the following requirements:

The intranet web server is open to internet users to enable staff to access the intranet even when they are not in the enterprise.

Solution

- You can use the Port Mapping function to enable internet users to access the intranet web server.
- You can use the DDNS function to enable internet users to access the intranet web server through a fixed domain name, avoiding access failures caused by WAN IP address change.
- You can use the DHCP Reservation function to avoid access failures caused by web server address change.

Assume that the information of the web server is shown as below:

- IP address of the web server: 192.168.0.250
- MAC address of the host that runs the web server: C8:9C:DC:60:54:69
- Service port: 9999

- Before the configuration, ensure that the WAN port of the router obtains a public IP address. If the WAN port obtains a private IP address or an intranet IP address assigned by the ISP, the DDNS function may not take effect. Common IPv4 addresses are classified into class A, class B and class C. Private IP addresses of class A range from 10.0.0.0 to 10.255.255.255. Private IP addresses of class B range from 172.16.0.0 to 172.31.255.255. Private IP addresses of class C range from 192.168.0.0 to 192.168.255.255.
 - ISPs may not support unreported web service accessed using the default port number 80. Therefore, when setting port mapping, you are recommended to set the external port as a non-familiar port (1024 to 65535), such as 9999, to ensure normal access.
 - Internal and external ports can be different.
-

Configuration procedure

Set port mapping

Reserve a fixed IP address for the DMZ host

Set DDNS

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Set port mapping.

Go to **More > Virtual Service > Port Mapping**, and set the following rules. If necessary, you can refer to [Port mapping](#).

Port Mapping

Port Mapping

☒ Enable
 ☐ Disable

Add

Internal IP Address	Internal Port	External Port	Protocol	Interface	Remark	Status ↓	Operation
192.168.0.250	9999	9999	TCP	WAN1	-	Enabled	Edit Disable Delete

3. Reserve a fixed IP address for the DMZ host.

- 1) Go to **Network > DHCP Reservation**, and click **Add**.

- 2) Set the following rules, and click **Save**.
 - Set **Terminal Name**, which is **Web Server** in this example.
 - Set **IP Address** to the fixed IP address assigned to the server host, which is **192.168.0.250** in this example.
 - Set **MAC Address** of the server host, which is **C8:9C:DC:60:54:69** in this example.
 - Set **Remark**, which is **Web Server Address** in this example.

- 3) The fixed IP address is reserved successfully. See the following figure.

4. Set DDNS.

- 1) Register a domain name.

Log in to the DDNS provider website. Assume that the user name you registered is **JohnDoe**, the password is **JohnDoe123456**, and the domain name is **JohnDoe.3322.org**.

- 2) Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **More > Virtual Service > DDNS** to set DDNS.
- 3) Click **Edit** after the corresponding WAN port rule, which is **WAN1** in this example.

DDNS							?
Interface	Connection Status	ISP	User Name	Domain Name	Status ↑	Operation	
WAN1	Disconnected	-	-	-	Disabled	Edit	

- 4) Configure the following parameters in the pop-up **Edit WAN1 DDNS** window, and then click **Save**.
- Set **Server Provider** (the DDNS provider where you applied the domain name), which is **3322.org** in this example.
 - Set **User Name** and **Password**, which are **JohnDoe** and **JohnDoe123456** in this example.
 - Set **Domain Name**, which is **JohnDoe.3322.org** in this example.

Edit WAN1 DDNS

Interface

WAN1

Server Provider

3322.org

- 5) Click **Enable**.

DDNS							?
Interface	Connection Status	ISP	User Name	Domain Name	Status ↑	Operation	
WAN1	Disconnected	3322	JohnDoe	JohnDoe.3322.org	Disabled	Edit Enable	

-----End

The configuration is finished. Wait a moment, and refresh the page. When the **Connection Status** is **Connected**, the connection is successful.

DDNS							?
Interface	Connection Status	ISP	User Name	Domain Name	Status ↓	Operation	
WAN1	Connected	3322	JohnDoe	JohnDoe.3322.org	Enabled	Edit Disable	

Verification

Internet users can successfully access the intranet server by using the **Intranet service application layer protocol name://WAN port IP address**. If the intranet service port is not the default port number, the access address is **Intranet service application layer protocol name://WAN port IP address:External port**.

In this example, the access address is `http://JohnDoe.3322.org:9999`.

If internet users still cannot access the LAN server after the configuration, try the following methods:

- Make sure that the internal port you entered is correct.
- Maybe the system firewall, anti-virus software and security guard on the LAN server blocked internet user access. Disable these programs and try again.

Parameter description

Parameter	Description
Interface	Specifies the port for which the DDNS service is enabled.
Connection Status	Specifies the connection status between the router and the domain server.
ISP	Specifies the service provider of DDNS.  TIP You need to sign up at the website of the ISP for an account before configuring the DDNS service.
User Name	Specifies the user name for logging in to the DDNS service. The user name is the login user name that you have signed up at the website of the ISP.
Domain Name	Specifies the domain name information provided by the DDNS service provider. Except for oray.com , you have to manually enter the domain name that you have applied at the corresponding website when you use services from other service providers.

9.2.3 Configure DNS hijacking

DNS is abbreviated for Domain Name Server, which is used to manage the relationships between the domain name and the IP address, and map the domain name and the IP address to each other.

After DNS hijacking is configured, when LAN users access the specified domain name, the domain name is directly parsed to the IP address corresponding to the access rule.

Example of configuring DNS hijacking

Networking requirements

An enterprise uses the wireless router to set up a network. The router has connected to the internet and can offer internet service for LAN users. The enterprise has the following requirements:

When LAN users visit Amazon (Amazon.com), eBay (eBay.com) and other websites, they can access the web UI of the router.

Solution

The above requirements can be achieved using the DNS hijacking function of the router. Assume that the IP address of the router is 192.168.0.1.

Configuration procedure

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **More > Virtual Service > DNS Hijacking**, and click **Add**.
3. Set the following rules of the DNS hijacking policy, and click **Save**.
 - 1) Set **Domain Name** of Amazon, which is **Amazon.com** in this example.
 - 2) Set **Map IP Address** of the router, which is **192.168.0.1** in this example.

Add DNS Hijacking

Domain Name: Amazon.com

Map IP Address: 192 . 168 . 0 . 1

Interface: Unspecified

Cancel Save

4. Refer to steps 2-3 to add a DNS hijacking policy whose domain name is eBay (eBay.com).

DNS Hijacking

Add

Domain Name	Map IP Address	Interface	Status ↓	Operation
eBay.com	192.168.0.1	Unspecified	Enabled	Edit Disable Delete
Amazon.com	192.168.0.1	Unspecified	Enabled	Edit Disable Delete

-----End

Verification

When LAN users visit Amazon (Amazon.com) and eBay (eBay.com) websites, they always visit the web UI of the router.

Parameter description

Parameter	Description
Domain Name	Specifies the domain name to be hijacked.
Map IP Address	Specifies the IP address to be accessed after the hijacking.
Interface	Specifies the specified egress of the DNS hijacking policy.

9.2.4 Configure DNS binding

The DNS binding function routes specified domain names to designated DNS servers through a fixed WAN port for resolution. This feature is typically used to achieve domain-specific DNS resolution and distribute DNS query traffic.

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **More > Virtual Service > DNS Binding**.
3. Click **Add**.
4. Configure parameters in the **Add DNS Binding** window, and click **Save**.
 - 1) Set **Domain Name**, which is **google.com** in this example.
 - 2) Set **DNS Server Address**, which is **8.8.8.8** in this example.
 - 3) Select **Interface**, which is **WAN1** in this example.

The screenshot shows a web-based configuration window titled "Add DNS Binding". It contains the following fields and values:

- Domain Name:** google.com
- DNS Server Address:** 8 . 8 . 8 . 8
- Interface:** WAN1 (selected from a dropdown menu)
- Remark:** (Optional) [empty field]

At the bottom right, there are two buttons: "Cancel" and "Save".

----End

9.2.5 Configure IP hijacking

After IP hijacking is configured, when a LAN user accesses a port of the specified IP address, the IP address will be directly hijacked to the mapped address.

Common ports: 443 (HTTPS protocol webpage service), 80 (HTTP protocol webpage service), 21 (FTP service) and so on.

Example of configuring IP hijacking

Networking requirements

An enterprise uses the wireless router to set up a network. The router has connected to the internet and can offer internet service for LAN users. The enterprise has the following requirements:

The LAN users are redirected to the web UI of the router when accessing 1.1.1.1.

Solution

You can configure the IP hijacking function to meet the preceding requirements.

Assume that the management IP address of the router is 192.168.0.1 and the port number of the HTTPS web service is 443.

Configuration procedure

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **More > Virtual Service > IP Hijacking**, and click **Add**.

3. Configure parameters in the **Add IP Hijacking** window, and click **Save**.
 - 1) Set **Destination IP Address**, which is **1.1.1.1** in this example.
 - 2) Set **Map IP Address**, which is **192.168.0.1** in this example.
 - 3) Set **Port**, which is **443** in this example.

-----End

Verification

When LAN users access **1.1.1.1:443**, they actually access the web UI of the router.

Parameter description

Parameter	Description
Destination IP Address	Specifies the IP address to which the IP hijacking policy applies.
Map IP Address	Specifies the IP address to be accessed after the hijacking.
Port	Specifies the port to which the IP hijacking policy applies. The IP addresses will be hijacked only when specified ports are accessed.  TIP The value 0 indicates all ports.
Interface	Specifies the specified egress of the IP hijacking policy.

9.2.6 Enable UPnP

UPnP is abbreviated for Universal Plug and Play. After the UPnP function is enabled, the router can automatically open the ports for UPnP-supporting programs in the LAN (such as BitComet and AnyChat) and make these applications run smoother.

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **More > Virtual Service > UPnP**.

You can enable the UPnP function. The UPnP function is disabled by default.

After this function is enabled, when UPnP-supporting programs (such as BitComet) are running in the LAN, you can check the port switching information generated when application programs send requests.

9.2.7 Configure port mapping

By default, users on the internet cannot access devices in the LAN. The Port Mapping function enables the router to open one or multiple service ports and specify the corresponding LAN server using the IP address and internal port. Therefore, visiting the ports from the internet are mapped to the LAN server. Such a function enables internet users to access the LAN server and prevents the LAN from being attacked.

Example of configuring port mapping

Networking requirements

An enterprise uses the wireless router to set up a network. The router has connected to the internet and can offer internet service for LAN users. The enterprise has the following requirements:

The intranet web server is open to internet users to enable staff to access the intranet even when they are not physically in the enterprise.

Solution

- You can use the Port Mapping function to enable internet users to access the intranet web server. Assume that the external network port opened by the router is 9999.
- You can use the DHCP Reservation function to avoid access failures caused by web server address change.

Assume that the information of the web server is shown as below:

- IP address of the web server: 192.168.0.250
- MAC address of the host that runs the web server: C8:9C:DC:60:54:69
- Service port: 9999

- Before the configuration, ensure that the WAN port of the router obtains a public IP address. If the WAN port obtains a private IP address or an intranet IP address assigned by the ISP, the Port Mapping function may not take effect. Common IPv4 addresses are classified into class A, class B and class C. Private IP addresses of class A range from 10.0.0.0 to 10.255.255.255. Private IP addresses of class B range from 172.16.0.0 to 172.31.255.255. Private IP addresses of class C range from 192.168.0.0 to 192.168.255.255.
 - ISPs may not support unreported web service accessed using the default port number 80. Therefore, when setting port mapping, you are recommended to set the external port as a non-familiar port (1024 to 65535), such as 9999, to ensure normal access.
 - Internal and external ports can be different.
-

Configuration procedure

Set port mapping

Set the fixed IP address assigned to the server host

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI .
2. Set port mapping.
 - 1) Go to **More > Virtual Service > Port Mapping**.
 - 2) Select **Enable** for **Port Mapping**, and click **Add**.
 - 3) Configure parameters in the **Add** window, and click **Save**.
 - Set **Internal IP Address** (the IP address of the web server), which is **192.168.0.250** in this example.
 - Set **Intranet Port** (the port used by the web server), which is **9999** in this example.
 - Set **External Port** (the port that the router opens to WAN users), which is **9999** in this example.
 - Set **Protocol**, which is **TCP** in this example. If you are not sure about the protocol type of the service, **TCP&UDP** is recommended.

- Set **Interface** (the WAN port used by Internet users to access the LAN server), which is **WAN1** in this example.

The 'Add Port Mapping' dialog box contains the following fields:

- Internal IP Address: 192 . 168 . 0 . 250
- Internal Port: 9999
- External Port: 9999
- Protocol: TCP
- Interface: WAN1
- Remark: (Optional)

Buttons: Cancel, Save

The port mapping policy is added successfully. See the following figure.

The 'Port Mapping' page shows the following configuration:

- Port Mapping: ☒ Enable ☐ Disable
- Add button

Internal IP Address	Internal Port	External Port	Protocol	Interface	Remark	Status ↓	Operation
192.168.0.250	9999	9999	TCP	WAN1	-	Enabled	Edit Disable Delete

3. Set the fixed IP address assigned to the server host.

- 1) Go to **Network > DHCP Reservation**, and Click **Add**.
- 2) Set the following rules, and click **Save**.
 - Set **Terminal Name**, which is **Web Server** in this example.
 - Set **IP Address** assigned to the server host, which is **192.168.0.250** in this example.
 - Set **MAC Address** of the server host, which is **C8:9C:DC:60:54:69** in this example.
 - Set **Remark**, which is **Web Server Address** in this example.

The 'Add DHCP Reservation' dialog box contains the following fields:

- Terminal Name: Web Server
- IP Address: 192 . 168 . 0 . 250
- MAC Address: C8:9C:DC:60:54:69
- Remark: Web Server Address (Optional)

Buttons: Cancel, Save

-----End

The fixed IP address is reserved successfully. See the following figure.

DHCP Reservation						
Add Delete Import Export Search						
☐	Terminal Name	Terminal Type	IP Address ↑	MAC Address	Remark	Status Operation
☐	Web Server	Others	192.168.0.250	C8:9C:DC:60:54:69	Web Server Address	Enabled Edit Disable Delete

Verification

Internet users can successfully access the intranet server by using the **Intranet service application layer protocol name://WAN port IP address**. If the intranet service port is not the default port number, the access address is **Intranet service application layer protocol name://WAN port IP address:External port**.

In this example, the access address is `http://202.105.11.22:9999`.

You can find the router's current WAN port IP address in [Connection Status](#).

If [DDNS](#) is enabled on the WAN port, internet users can also access the intranet server by using **Intranet service application layer protocol name://WAN port domain name:External port**.

If internet users still cannot access the LAN server after the configuration, try the following methods:

- Make sure that the internal port you entered is correct.
- Maybe the system firewall, anti-virus software and security guard on the LAN server blocked internet user access. Disable these programs and try again.

Parameter description

Parameter	Description
Internal IP Address	Specifies the IP address of the LAN host that needs to be mapped.
Internal Port	Specifies the service port of the LAN host.
External Port	Specifies the port opened by the router for access from internet users.
Protocol	Specifies the protocol type used by the LAN host. If you are not sure about the protocol type of the service, TCP&UDP is recommended.
Interface	Specifies the WAN port used by internet users to access the LAN host.
Remark	Specifies the description of the port mapping rule.

9.3 Maintenance service

9.3.1 Configure remote web management

Generally, you can log in to the web UI of the router only when you connect to the LAN port or the WiFi network of the router. However, the Remote Web Management function enables access to the web UI remotely through the WAN port in special cases (like when you need remote technical support).

Example of configuring remote web management

Networking requirements

An enterprise uses the enterprise router to set up a network. The network administrator encountered a problem during network setup and needs the Tenda technical support to remotely log in to the web UI of the device to perform analysis and troubleshooting.

Solution

You can use the Remote Web Management function to meet the requirements.

Configuration procedure

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **More > Maintenance Service > Remote Web Management**.
3. Enable **Remote Web Management**.
4. Set **Specified WAN Port**, which is **WAN1** in this example.
5. Set **Remote IP Address** as **Specified Address**. And enter the IP address of the computer supported by Tenda technology, which is **202.105.88.77** in this example.
6. Click **Save**.

Remote Web Management

Remote Web Management ☒ Enable ☐ Disable

Specified WAN Port WAN1

Remote IP Address Specified Address 202 . 105 . 88 . 77

Remote Management Address http://fy8q6bao.cloud.tendacn.net:8080 Copy

-----End

Verification

The Tenda technical support technician can Log in to the web UI of the router by visiting <http://fy8q6bao.cloud.tendacn.net:8080> on the computer (the IP address of the computer is 202.105.88.77).

Parameter description

Parameter	Description
Remote Web Management	Used to enable or disable the Remote Web Management function.
Specified WAN Port	Specifies the WAN port used when accessing the web UI of the router from the internet remotely. When multiple WAN ports are available, you can select any one of them.

Parameter	Description
Remote IP Address	Specifies the IP address of the device that can access the web UI of the router remotely. - All Addresses: Devices with any IP address on the internet can access the web UI of the router. For network security, this option is not recommended. - Specified Address: Only devices with specified IP addresses can access the web UI of the router. If the device is in the local area network, the IP address (public IP address) of the gateway of the device should be filled in.
Remote Management Address	Specifies the domain name used for remote access. This domain name is generated by the router, and internet users can access the web UI of the router using the domain name when the Remote Web Management function is enabled.

9.3.2 Security settings

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **More > Maintenance Service > Security Settings**.

You can enable corresponding attack defense functions according to the actual network conditions.

Security Settings

Block Ping from WAN ☐ Enable ☒ Disable

LAN DDoS Attack Defense ☐ Enable ☒ Disable

ARP Attack Defense ☐ Enable ☒ Disable

Binary Association ☐ Enable ☒ Disable

Login Timeout Interval

Save

Parameter description

Parameter	Description
Block Ping from WAN	Used to enable or disable the Block Ping from WAN function. With this function enabled, when a WAN host pings the IP address of the WAN port on the router, the router automatically ignores the Ping request to prevent itself from being exposed and defend against external Ping attacks.

Parameter	Description
LAN DDoS Attack Defense	Used to enable or disable the LAN DDoS Attack Defense function. DDoS attack indicates the distributed denial of service attack. The attack allows an attacker to exhaust the resources of a system, making the system unable to properly provide services. With this function enabled, the router can defend common DDoS attacks from the internal network.
ARP Attack Defense	Used to enable or disable the ARP Attack Defense function. With this function enabled, the router can identify ARP spoofing in the LAN and record the MAC address of the attacker.
Binary Association	Used to enable or disable the Binary Association function. With this function enabled, only devices whose IP addresses are bound with MAC addresses in the list to access the internet.
Login Timeout Interval	Used to set the login timeout interval. After logging in to the web UI of the router, you will be automatically logged out when no operation is performed within the defined time period.

9.3.3 Add router to Tenda CloudFi cloud

The Tenda CloudFi cloud management system is a cloud platform established by Tenda, providing central management for Tenda devices that support cloud management.

The router can be managed by the Tenda CloudFi cloud platform. You can add the router to the cloud platform through the web UI of the Tenda CloudFi cloud platform (<https://cloudfi.tendacn.com>) or the Tenda CloudFi App to remotely manage and maintain it.

Networking requirements

An enterprise uses the enterprise router to set up a network and has successfully connected to the internet. The requirements are managing the router remotely and delivering related configurations.

Solution

You can use the Cloud Management function of the router and Tenda CloudFi cloud management system (<https://cloudfi.tendacn.com> or the Tenda CloudFi App) to meet the requirements.

Configuration procedure

Before configuring the cloud maintenance function of the router, ensure that the router is connected to the internet.

Via Tenda CloudFi App

1. Download the App to your smartphone by scanning the QR code or searching for **Tenda CloudFi** in **Google Play** or **App Store**.

Or

2. Connect your smartphone to the Wi-Fi network of the router.
3. Open your App, and add the router to the Tenda CloudFi App.

- 1) Add a project on the App. (Skip if performed)
- 2) Tap the project to which you want to add the router, tap the pop-up window that shows the router is detected, and add the router to the project.

----End

You can view the **Help Documentation** on the **Help Center** page of the Tenda CloudFi App for specific methods.

Via Tenda CloudFi cloud platform

1. Obtain the unique cloud code.
 - 1) On a computer that has connected to the internet, start a web browser, visit <https://cloudfi.tendacn.com>, and log in to the web UI of Tenda CloudFi cloud platform.
 - 2) Click **Add** in the upper right corner and select **Unique Cloud Code**.
 - 3) Click **Copy** to copy the **Unique Cloud Code**.

Unique Cloud Code can also be obtained on the **Account** page of the Tenda CloudFi App.

2. Enable the cloud maintenance function for the router.
 - 1) Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
 - 2) Go to **More > Maintenance Service > Cloud Maintenance**.
 - 3) Set **Cloud Maintenance** to **Enable**.
 - 4) Enter the **Unique Cloud Code**, set **Device Info Report** to **Enable**, and click **Save**. Confirm the prompt information (if it pops up) and click **OK**.

Cloud Maintenance

Cloud Maintenance ☒ Enable ☐ Disable
 After the Cloud Maintenance function is enabled, a device can be associated by the CloudFi Platform.

Unique Cloud Code
 Unique Cloud Code is used to associate the device to your Tenda cloud platform account. You can obtain this code on Tenda CloudFi web UI (<https://cloudfi.tendacn.com>)

Device Info Report ☒ Enable ☐ Disable
 Note: If the Device Info Report function is disabled, the device cannot be managed by the cloud, and relevant functions in Cloud Maintenance are not available.

Save

3. Add a project on the web UI of Tenda CloudFi cloud platform and add the router to the project.

- 1) Log in to the web UI of Tenda CloudFi cloud platform (<https://cloudfi.tendacn.com>). Click **Add** in the upper right corner and select **Device-joining Alert**.
- 2) Select the router to be added to the project and click **Add Device to Project**. The following figure is for reference only.

Device-joining Alert

Only one gateway can be added to the project.

Add Device to Project

☒	Device Type	Model	MAC Address	Public IP Address	Request Time ↑
☒	Wireless Router	W18EV2.0			2025-07-23 01:42:03 (GMT)

- 3) Select the project to which you want to add the router. The following figure is for reference only.
 - If the project has already been created, select **Existing Project**, select the corresponding project in the **Project Name** drop-down menu, and then click **Confirm**.

Add Device to Project

Add Device to ☒ Existing Project ☐ Add Project

Project Name

Project Scenario

Project Location

Time Zone

Cancel **Confirm**

- If you want to create a new project, select **Add Project**, set the **Project Name**, **Project Scenario** and **Project Location**, and then click **Confirm**.

The dialog box titled "Add Device to Project" contains the following fields:

- Add Device to:** Radio buttons for "Existing Project" and "Add Project" (selected).
- Project Name:** Text input field with placeholder "Enter Project Name".
- Project Scenario:** Dropdown menu with "Select Project Scenario".
- Project Location:** Dropdown menu with "Select Project Location".
- Time Zone:** Dropdown menu with "(GMT+08:00) Beijing, Chongqi".

Buttons at the bottom: "Cancel" and "Confirm".

Added successfully. You can enter the **Project** page to view details. The following figure is for reference only.

The interface shows a sidebar with "Overview" and "Project" (selected). The main area is titled "Project" and contains a table of projects.

No.	Status	Project Name	Project Property	Project Scenario	Project Location	Online Devices	Offline Devices	Unread Alarms	Operation
1	Online	XX Enterprise Network	By Creation	Office	American Samoa-Swains	1	-	-	Edit, Delete, Share

Buttons: "Add Project", "Search".

---End

Verification

After the configuration is completed, the router can be managed through the Tenda CloudFi cloud management system (<https://cloudfi.tendacn.com> or the Tenda CloudFi App), and all its configuration information is delivered by the Tenda CloudFi cloud management system.

9.4 VPN

VPN, abbreviated for Virtual Private Network, is a special network set up on the public network (generally the internet). It exists only logically and does not have any physical lines. The VPN technology is widely used in enterprise networks and is used to achieve resource sharing between a subsidiary and the headquarters, and at the same time, protects these resources from being exposed to other users on the internet.

The typical network topology is shown as below.

Common VPN services include PPTP (Point-to-Point Tunneling Protocol), L2TP (Layer 2 Tunneling Protocol), and IPsec (IP Security).

- **PPTP:** Offers relatively low security and should be avoided in any scenario where security is a concern.
- **L2TP/IPsec:** Provides stronger security than PPTP and is the recommended choice.

9.4.1 Configure PPTP/L2TP server

This router can function as a PPTP/L2TP server to accept VPN connections from a PPTP/L2TP client.

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Configure a PPTP/L2TP server.
 - 1) Go to **More > VPN Service > VPN Server**.
 - 2) Click **Add**, and configure the following parameters as required. Then click **Save**.

VPN Server
?

Add

Server Name	VPN Type	Ingress and Egress	Encryption	Client Address Pool	Status ↓	Operation
No Data						

Parameter description

Parameter	Description
Server Name	Specifies the name of the VPN server.
VPN Type	Specifies the VPN server type of the router, including PPTP and L2TP. Both PPTP and L2TP are Layer 2 VPN tunneling protocols, use Point-to-Point Protocol (PPP) for data encapsulation, and add additional headers to the data. – PPTP: The router works as a PPTP server and can connect to PPTP clients. – L2TP: The router works as a L2TP server and can connect to L2TP clients.
Ingress and Egress	Specifies the WAN port used for the connection between the VPN server and VPN client. The IP address or domain name of the WAN port is the Server IP Address/Domain Name of the VPN client.
Encryption	– PPTP: Specifies whether to enable the 128-bit data encryption. The encryption settings of PPTP server and PPTP client must be consistent. Otherwise, communications cannot be conducted normally. – L2TP: Specifies whether to encrypt data packets by enabling the IPsec. The encryption settings of L2TP server and L2TP client must be consistent. Otherwise, communications cannot be conducted normally.
Pre-shared Key	Specifies the pre-shared key of the L2TP server and the L2TP client. When the L2TP tunnel uses IPsec for encryption, both the L2TP client and the L2TP server use this pre-shared key to authenticate each other. The pre-shared key of the L2TP client and the L2TP server should be the same.
Client Address Pool	Specifies the IP address range within which the VPN server can assign IP addresses to VPN clients.

3. Configure PPTP or L2TP user accounts. When the PPTP or L2TP server is enabled, VPN clients need to use accounts to dial up the VPN on the router.

- 1) Go to **More > VPN Service > User Management**.
- 2) Click **Add**, and configure the following parameters as required. Then click **Save**.

The screenshot shows a 'User Management' window with a table of users. Below the table is an 'Add User' dialog box. The dialog box has the following fields:

- VPN Type: Automatic (dropdown)
- User Name: (text input)
- Password: (password input with eye icon)
- Client Type: Terminal (dropdown)
- Remark: (text input) (Optional)

At the bottom of the dialog box are 'Cancel' and 'Save' buttons.

Parameter description

Parameter	Description
VPN Type	Specifies the service type of the client. Automatic indicates that the client can be either a PPTP user or a L2TP user.
User Name	Specifies the user name required for the VPN connection.
Password	Specifies the password required for the VPN connection.
Client Type	Specifies the type of the VPN client. - Select Terminal when the VPN client is a single host. - Select Network Device when the VPN client is a network (such as a router), enabling all devices connected to the router to access the VPN server.
Client Subnet	Specifies the IP address range of the client intranet. It is available only when the Client Type is set to Network Device .
Access IP Address	Specifies the IP address of the actual physical network adapter of the VPN client.
Assigned IP Address	Specifies the IP address that the server assigns to VPN client.

---End

9.4.2 Configure PPTP/L2TP client

This router can function as a PPTP/L2TP client to establish VPN connections with a PPTP/L2TP server.

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **More > VPN Client**.
3. Set **VPN Client** to **Enable**.
4. Select **Client Type**. Then configure the following parameters as required and click **Save**. The following figure is for reference only.

---End

Parameter description

Parameter	Description
VPN Client	Used to enable or disable the VPN client function. After this function is enabled, the router works as a VPN client.
Client Type	Specifies the VPN client type of the router, including PPTP and L2TP. Both PPTP and L2TP are Layer 2 VPN tunneling protocols, use Point-to-Point Protocol (PPP) for data encapsulation, and add additional headers to the data. – PPTP: Select PPTP when the VPN server is a L2TP server. – L2TP: Select L2TP when the VPN server is a PPTP server.
WAN Port	Specifies the WAN port of the PPTP/L2TP client for setting up a connection with the PPTP/L2TP server.

Parameter	Description
Server IP Address/Domain Name	Specifies the IP address or domain name of the VPN server. Generally, it is the IP address or domain name of the WAN port with the PPTP/L2TP server function enabled on the peer VPN router.
User Name Password	Specify the username and password assigned by the VPN server to the VPN client.
Encryption	Specifies whether to enable 128-bit data encryption. The value of this parameter must be consistent with that of the server. Otherwise, the client is unable to communicate with the server. Only PPTP VPNs support this parameter.
VPN Agent	With this function enabled, clients on the LAN can obtain IP addresses from the VPN server to access the internet.
Remote LAN	Specifies the network segment of the LAN of the PPTP/L2TP server.
Remote Subnet Mask	Specifies the subnet mask of the LAN of the PPTP/L2TP server.

9.4.3 Example of configuring a PPTP/L2TP VPN

Networking requirement

The headquarters and subsidiary used routers to set up a network and successfully access the internet. The subsidiary staff need to access intranet resources through the internet, such as internal documents, office OA, ERP system, CRM system, and project management system.

Solution

Configure the router of the headquarters as the VPN server and the router of the subsidiary as the VPN client to enable remote users to securely access the intranet through the internet. PPTP VPN is taken for example here and the configuration of L2TP VPN is similar.

Assume that the WAN1 IP address of the headquarters' enterprise-class router is 202.105.11.22.

Configuration procedure

I. Configure the router 2 of the headquarters as the VPN server

1. Start a web browser on a device that is connected to the router 2, visit **tendawifi.com**, and log in to router's web UI.
2. Configure the PPTP server.

The following table provides the examples of PPTP server parameters.

Server Name	VPN Type	Ingress and Egress	Encryption	Client Address Pool
PPTP Server	PPTP	WAN1	Encrypted	10.1.0.100 to 10.1.0.163

Go to **More > VPN Service > VPN Server**, click **Add** to configure the relevant parameters of the PPTP server, and click **Save**.

The screenshot shows the 'Edit VPN Server' configuration window. The fields are as follows:

- Server Name: PPTP Server
- VPN Type: ☒ PPTP, ☐ L2TP
- Ingress and Egress: WAN1
- Encryption: Encrypted
- Client Address Pool: 10 . 1 . 0 . 100 ~ 10 . 1 . 0 . 163

Buttons: Cancel, Save

3. Configure the PPTP user.

The following table provides the examples of PPTP user parameters.

VPN Type	User Name	Password	Client Type	Client Subnet
PPTP	Subsidiary1	Subsidiary1	Network Device	192.168.0.0/24

Go to **More > VPN Service > User Management**, click **Add** to configure the relevant parameters of the PPTP user, and click **Save**.

The screenshot shows a web-based configuration window titled "Add User". It contains the following fields and values:

- VPN Type:** PPTP (selected from a dropdown)
- User Name:** Subsidiary1
- Password:** Masked with 10 dots, with a toggle icon to show/hide.
- Client Type:** Network Device (selected from a dropdown)
- Client Subnet:** 192.168.0.0 / 24
- Remark:** (Optional) [Empty text box]

At the bottom right, there are two buttons: "Cancel" and "Save".

II. Configure the router 1 of the subsidiary as the VPN client

1. Start a web browser on a device that is connected to the router 1, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **More > VPN Client**.
3. Set **VPN Client** to **Enable**.
4. Retain default settings **PPTP** for **Client Type**, and **WAN1** for **WAN Port**.
5. Enter **Server IP Address/Domain Name**, which is **202.105.11.22** in this example.
6. Enter **User Name** and **Password** used by the VPN client for VPN dial-up, both of which are **Subsidiary1** in this example.
7. Enable the **Encryption** function.
8. Set **Remote LAN** (network segment and subnet mask), which is **192.168.0.0/255 255.255.0** in this example.
9. Click **Save**.

Verification

When **Status** is displayed as **Connected**, Staff of the subsidiary can securely access the VPN resources from the headquarters.

9.4.4 IPSec

IP Security (IPSec) is a protocol suite for transmitting data over the internet in a secure and encrypted manner.

- **Encapsulation mode**

Encapsulation mode specifies encapsulation mode of the data transmitted by IPSec.

Tunnel: This mode adds an additional IP head and is most commonly used between gateways. The whole IP data packet of the user is used to calculate the AH or ESP head. AH or ESP head and the user data encrypted by ESP are encapsulated in a new IP data packet.

- **Security gateway**

It refers to a gateway (secure and encrypted router) with the IPSec functionality. IPSec is used to protect data exchanged between such gateways from being tampered and peeped.

- **IPSec peer**

The two IPSec terminals are called IPSec peers. The two peers (security gateways) can securely exchange data only after a Security Association (SA) is set up between them.

- **SA**

SA specifies some elements of the peers, such as the base protocol (AH, ESP, or both), encapsulation mode (transport or tunnel), encryption algorithm (DES, 3DES, or AES), shared key for data protection in specified flows, and life cycle of the key. SA has the following features:

- A triplet {SPI, Destination IP address, Security protocol identifier} is used as a unique ID.
- A SA specifies the protocol, algorithm, and key for processing packets.
- Each IPsec SA is unidirectional with a life cycle.
- A SA can be created manually or generated automatically using internet Key Exchange (IKE). The IKE protocol has two versions of IKEv1 and IKEv2. The device supports IKEv1 and the IKE hereinafter stands for IKEv1.

Configure IPSec connection: Tunnel mode

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **More > VPN Service > IPSec**.

Click **Add**, select the **Tunnel** mode, configure the following parameters in the window, and click **Save**.

The screenshot shows the 'Add IPSec' configuration window. It includes the following fields and options:

- IPSec**: Radio buttons for **Enable** (selected) and **Disable**.
- WAN Port**: A dropdown menu showing **WAN1**.
- Encapsulation Mode**: A dropdown menu showing **Tunnel**.
- Tunnel Name**: An empty text input field.
- Exchange Mode**: A dropdown menu showing **Initiator Mode**.
- Tunnel Protocol**: A dropdown menu showing **ESP**.
- Remote Gateway**: A text input field with the placeholder 'IP Address/Domain Name' and a blue plus icon to its right.
- IKE Version**: Radio buttons for **IKE v1** (selected) and **IKE v2**.
- Subnet Range**: Two text input fields, both containing '192.168.100.0/24'. To the right is the text 'For example: 192.168.100.0/24'. Below these fields is a dashed box containing the labels 'Local Subnet' and 'Peer Subnet' separated by a blue plus icon.
- Key Negotiation**: A dropdown menu showing **Auto Negotiation**.
- Authentication Type**: A dropdown menu showing **Shared key**.
- Pre-shared Key**: An empty text input field.
- DPD Detection**: A dropdown menu showing **Enable**.

At the bottom right of the window are two buttons: **Cancel** and **Save**.

Parameter description

Parameter	Description
IPSec	Used to enable or disable the IPSec function.
WAN Port	Specifies the WAN port over which the IPSec function takes effect. The remote gateway address of the IPSec peer device should be the IP address of this interface.
Encapsulation Mode	Specifies the IPSec data encapsulation mode. Tunnel: This mode is generally used between two security gateways.
Tunnel Name	Specifies the name of the IPSec tunnel.
Exchange Mode	Specifies the exchange mode of the IPSec tunnel. Initiator Mode: The device sends a connection request to the peer device. Responder Mode: The device waits for the peer device to send a connection request.  TIP Do not set both ends of the IPSec tunnel as Responder Mode; otherwise, the IPSec tunnel setup fails.
Tunnel Protocol	Specifies the protocol which offers the security service for IPSec. AH: It is abbreviated for Authentication Header. This protocol is used for verifying data integrity. If a packet is tampered during transmission, the receiver discards it during data integrity verification. ESP: It is abbreviated for Encapsulating Security Payload. This protocol is used for verifying data integrity and encrypting data. If a packet processed using this protocol is intercepted during transmission, it is difficult for the intercepting party to obtain the real information contained in the packet. This compatible protocol is widely used in gateway products.
Remote Gateway	Specifies the IP address or domain name of the peer gateway of the IPSec tunnel.  TIP When it is set to a domain name, the DDNS function has to be configured in the remote gateway to ensure that the use of IPSec tunnel is not affected by the changeable WAN port IP address of the remote gateway.
Local LAN/Mask	Specifies the network segment/prefix length of the LAN of the device. For example, if the IP address of the LAN port of the device is 192.168.0.1 and the subnet mask is 255.255.255.0, the local LAN/prefix length can be 192.168.0.0/24.
Remote LAN/Mask	Specifies the network segment/prefix length of the LAN of the peer gateway of the IPSec tunnel. If the peer device is a host, this parameter can be set as "the IP address of the device/32".
IKE Version	Specifies the Internet Key Exchange (IKE) protocol, including two versions: IKEv1 and IKEv2. Select it based on the protocol actually supported by the peer device.
Subnet Range	When Local LAN/Mask and Remote LAN/Mask are set, the parameters here will be automatically filled.

Parameter	Description
Key Negotiation	Specifies the key negotiation mode of the IPsec security tunnel. Auto Negotiation: It indicates that a SA is set up, maintained, and deleted automatically using IKE (Internet Key Exchange). This reduces configuration complexity and simplifies IPsec usage and management. Such a SA (Security Association) has a life cycle and is updated regularly, leading to higher security.

Key negotiation: Auto negotiation

To protect information confidentiality when using auto negotiation, IKE is in place to negotiate keys for secure communication between IPsec peers. The IKE protocol is a hybrid of three other protocols:

- **ISAKMP:** Internet Security Association and Key Management Protocol. It defines the procedures for authenticating a communicating peer, creation and management of Security Associations, key generation techniques, and threat mitigation.
- **Oakley:** Oakley Key Determination Protocol. It defines the specific key negotiation mechanism.
- **SKEME:** A secure and versatile key exchange protocol for key management over internet is presented.

IKE negotiation can be broken down into two periods.

Period 1: The communicating parties negotiate exchange and authentication algorithm, encryption algorithm and other security protocols, and generate an ISAKMP SA which is used to exchange more information in phase II.

Period 2: The ISAKMP SA set up in phase I is used as the security agreement negotiation parameter of IPsec to create IPsec SA, which is used to protect the communication data of both parties

When **Auto Negotiation** is selected, the following page appears.

The screenshot shows a configuration window with the following settings:

- Key Negotiation:** A dropdown menu currently showing 'Auto Negotiation'.
- Authentication Type:** A text field containing 'Shared key'.
- Pre-shared Key:** An empty text input field.
- DPD Detection:** A dropdown menu currently showing 'Enable'.
- DPD Detection Cycle:** A text input field containing '10', followed by a unit selector showing 's' (seconds) and an information icon.

Parameter description

Parameter	Description
Authentication Type	Specifies the shared key mode, which indicates a shared key string negotiated by IPSec parties with some way in advance.
Pre-shared Key	Specifies the pre-shared key used during negotiation. This parameter must be the same with that of the peer gateway. A maximum of 128 characters are allowed.
DPD Detection	Used to enable or disable the DPD Detection. This function can detect whether the remote tunnel site is valid.
DPD Detection Cycle	Specifies the cycle of transmitting DPD packets. The device transmits DPD packets based on the cycle set here. If the DPD packets are not confirmed by the remote peer device during the cycle period, the device re-initializes the IPSec SA between the both sides.

Parameter description

Parameter	Description
Mode	Specifies the exchange mode in IKE phase I, which should be the same as that of peer gateway. – Main: This mode is the primary mode. In this mode, exchanged packets are huge to offer identity protection, which is applicable to scenarios where identity protection is rigorous. – Aggressive: This mode does not offer identity protection. In this mode, the exchanged packets are few in number and negotiation rate is high, which is applicable to scenarios where identity protection is loose.
Encryption Algorithm	Specifies the IKE session encryption algorithm. The router supports the following algorithms: – DES (Data Encryption Standard): A 56-bit key is used to encrypt 64-bit data. The last 8 bits of the 64-bit data are used for parity check. 3DES indicates that three 56-bit keys are used for encryption. – AES (Advanced Encryption Standard): AES 128/192/256 indicates that 128/192/256-bit keys are used for encryption respectively.
Integrity Verification	Specifies the IKE session verification algorithm. The router supports the following algorithms: – MD5 (Message Digest Algorithm): A 128-bit message digest is generated to prevent message tampering. – SHA1 (Secure Hash Algorithm): A 160-bit message digest is generated to prevent message tampering, leading to higher security than MD5.
Diffie-Hellman Group	Specifies the group information for the Diffie-Hellman algorithm for generating a session key used to encrypt an IKE tunnel.
Local ID Type	Specifies the ID of the local gateway. – IP Address: The router uses the IP address of the specified WAN port for negotiation with the remote gateway. – FQDN: Fully Qualified Domain Name. If you select FQDN, you need to manually set a string of characters, which should be identical with the remote ID.  TIP Local ID Type and Peer ID Type should be the same. Under such circumstances, you are recommended to modify the Mode to Aggressive.
Peer ID Type	Specifies the ID of the remote gateway. – IP Address: By default, the remote gateway uses the WAN IP address of the router for negotiation. – FQDN: Fully Qualified Domain Name. If you select FQDN, you need to manually set a string of characters, which should be identical with the local ID.
Key Expiration	Specifies the life cycle of ISAKMP SA.

Parameter	Description
PFS	This feature generates a new key in IKE Phase II, which is unrelated to the key generated in IKE Phase I, ensuring that the key generated in Phase II is secure even if the key generated in IKE1 Phase I is cracked. With the PFS disabled, generation of the new key in IKE Phase II depends on the key in Phase I. Once the key generated in IKE Phase I is cracked, the key generated in Phase II will suffer threats, and further threatens the communication security.

View IPsec list

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **More > VPN Service > IPsec List**.

After the devices at both ends of the IPsec tunnel are configured, you can view the IPsec SA in the IPsec list.

IPsec List								
Name	SPI	Direction	Tunnel ID	Data Flow	Protocol	AH Authentication	ESP Authentication	ESP Encryption
No Data								

Parameter description

Parameter	Description
Name	Specifies the name of the IPsec tunnel policy.
SPI	Specifies the Security Parameter Index (SPI) of the current tunnel, which is obtained through automatic IKE negotiation.
Direction	Specifies the direction of the tunnel (in: flow in, out: flow out). Because IPsec rules are one-way, when an IPsec tunnel is successfully established, each tunnel will generate a pair of "in and out" IPsec rules with the same name.
Tunnel ID	Specifies the gateway addresses of two sides of the tunnel.
Data Flow	Specifies the subnet masks of two sides of the tunnel.
Protocol	Specifies the protocol which offers the security service for IPsec. AH: It is abbreviated for Authentication Header. This protocol is used for verifying data integrity. If a packet is tampered during transmission, the receiver discards it during data integrity verification. ESP: It is abbreviated for Encapsulating Security Payload. This protocol is used for verifying data integrity and encrypting data. If a packet processed using this protocol is intercepted during transmission, it is difficult for the intercepting party to obtain the real information contained in the packet. This compatible protocol is widely used in gateway products.

Parameter	Description
AH Authentication	Specifies the AH authentication algorithm used by the tunnel, which is determined by the proposal of the second phase of IKEv1.
ESP Authentication	Specifies the ESP authentication algorithm used by the tunnel, which is determined by the proposal of the second phase of IKEv1.
ESP Encryption	Specifies the ESP encryption algorithm used by the security protocol, which is determined by the security proposal in the second phase of IKEv1.

Example of configuring an IPsec VPN

Networking requirements

An enterprise and its subsidiary both use routers to set up a network and the routers have been connected to the internet.

The enterprise has the following requirement:

Subsidiary staff can access the LAN resources through the internet, such as documents, OA, ERP system, CRM system, project management system and other resources.

Solution

Set up an IPsec tunnel on the two routers for the remote users to securely access the LAN through the internet.

Assume that router 1 is deployed in the headquarters and its basic information is as follows:

- Port used to establish an IPsec tunnel: WAN1
- WAN1 IP address: 202.105.11.22
- IP address of the LAN: 192.168.0.0/24

Assume that router 2 is deployed in the subsidiary and its basic information is as follows:

- Port used to establish an IPsec tunnel: WAN1
- WAN IP address: 202.105.88.77
- IP address of the LAN: 192.168.1.0/24

Assume that the basic information of the IPsec connection between the two routers is:

- Encapsulation mode: Tunnel
- Key negotiation mode: Auto negotiation
- Pre-shared key: td159357

Configuration procedure

Configure router 1

Configure router 2

During the configuration, if you want to configure the advanced settings of IPSec connection, make sure the parameters of the two routers are the same.

1. Configure router 1.

- 1) Start a web browser on a device that is connected to the router 1, visit **tendawifi.com**, and log in to router's web UI, Then go to **More > IPSec**.
- 2) Click **Add**.

IPSec

Add

Delete

☐	IPSec Status	WAN Port	Tunnel Name	Encapsulation Mode	Tunnel Protocol	Remote Gateway	Status	Operation
No Data								

- 3) Configure the parameters in the **Add** window, and click **Save**.
 - Select the WAN port to establish an IPSec tunnel, which is **WAN1** this example.
 - Set **Encapsulation Mode** to **Tunnel**.
 - Set the **Tunnel Name**, which is **IPSec_1** in this example.
 - Enter the **Remote Gateway**, which is **202.105.88.77** in this example.
 - Enter the **Local LAN/Mask**, which is **192.168.0.0/24** in this example.

- Enter the **Remote LAN/Mask**, which is **192.168.1.0/24** in this example.
- Set the **Pre-shared Key**, which is **td159357** in this example.

The IPsec is added successfully. See the following figure.

IPsec Status	WAN Port	Tunnel Name	Encapsulation Mode	Tunnel Protocol	Remote Gateway	Status	Operation
☐ Disconnected	WAN1	IPsec_1	Tunnel	ESP	202.105.88.77	Enabled	Edit Disable Delete

2. Configure router 2.

- 1) Start a web browser on a device that is connected to the router 2, visit **tendawifi.com**, and log in to router's web UI, Then go to **More > IPsec**.
- 2) Click **Add**.

IPSec							
Add Delete							
☐	IPSec Status	WAN Port	Tunnel Name	Encapsulation Mode	Tunnel Protocol	Remote Gateway	Status Operation

Verification

When **IPSec Status** shows **Connected**, the IPSec tunnel is set up successfully and headquarters and subsidiary staff can securely access the LAN resources of each other through internet.

9.5 Modify IPv6 internet connection

IPv6, abbreviated for Internet Protocol Version 6, is the second-generation network layer protocol. IPv6 is an upgraded version of Internet Protocol version 4 (IPv4), which is the solution that addresses the relatively limited number of IP addresses possible under IPv4.

IPv6 address

An IPv6 address is 128 bits long and is arranged in eight groups, each of which is 16 bits. Each group is expressed as four hexadecimal digits and the groups are separated by colons. An IPv6 address is split into two parts:

- Network Prefix: n bits, equivalent to the network ID in the IPv4 address.
- Interface Identifier: 128-n bits, equivalent to the host ID in the IPv4 address.

Basic concept

- **DHCPv6**

Dynamic Host Configuration Protocol for IPv6 (DHCPv6) is a stateful protocol that assigns IPv6 addresses or prefixes and other configuration parameters to hosts.

- **SLAAC**

Stateless Address Autoconfiguration (SLAAC) is a stateless protocol. Hosts automatically generate IPv6 addresses or prefixes and other configuration parameters through Router Advertisement (RA).

9.5.1 Modify WAN

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **More > IPv6 > Internet**.

You can configure the IPv6 address of the corresponding WAN port.

There are two methods to obtain IPv6 addresses. Select the method based on the configuration of the upstream device.

Condition	Selection
The IP address assignment modes of the LAN port on the upstream device are DHCPv6, SLAAC or DHCPv6+SLAA.	
The upstream device is the ISP device, and the ISP provides a PPPoE account and password that supports IPv6 service.	Auto
The upstream device is the ISP device, and the ISP does not provide specific network parameters.	
The upstream device does not assign IP addresses.	
The upstream device is the ISP device, and the ISP provides a group of fixed IPv6 addresses for internet access, including the IP address, subnet mask, default gateway and DNS server information.	Manual

NOTE

If the WAN port is directly connected to the ISP network, ensure that you have enabled the IPv6 internet service. If you are not sure, contact your ISP first.

Auto

The WAN port automatically obtains IPv6 internet access information through DHCPv6 or SLAAC. After the IPv6 parameters of the WAN port are configured, you can view the IPv6 networking status in the **Connection Status** module on the right. The following figure is for reference only.

Parameter description

Parameter	Description
Mode	Status Used to enable or disable the IPv6 function of the corresponding WAN port.
	IPv6 Address Obtain Method Select Auto .
	DNS Obtain Method Specifies the method of the WAN port to obtain the DNS server address. – Auto: The DNS server address is automatically obtained through DHCPv6 or SLAAC. – Manual: Enter the DNS server address manually.
	Primary DNS Enter a correct IPv6 DNS server address.
	Secondary DNS  TIP If there is only one DNS address, Secondary DNS is not required.
	Hardware Connection Specifies the current rate and duplex mode of the WAN port.
	Status Specifies the connection status of the WAN port of the router. – Connected: The WAN port of the router has been plugged into the Ethernet cable, and the IPv6 address information has been obtained. – Connecting...: The router is connecting to the upstream network device. – Disconnected: If it is not connected or fails to connect, check the Ethernet cable connection status and internet settings, or consult the corresponding ISP.
Connection Status	Duration Specifies the duration of the WAN port access to the IPv6 network.
	IPv6 Address Specifies the IPv6 global unicast address of the WAN port.
	Subnet Prefix Length Specifies the network prefix number of the IPv6 address.
	Default Gateway Specifies the IPv6 default gateway of the WAN port.
	Primary DNS Specify the primary or secondary IPv6 DNS server address of the WAN port.
	Secondary DNS

Manual

Access the internet using the fixed IPv6 address provided by ISP.

Parameter	Description
Status	Used to enable or disable the IPv6 function of the corresponding WAN port.
IPv6 Address Obtain Method	Select Manual .
IPv6 Address	Enter the IPv6 global unicast address provided by ISP.
IPv6 Default Gateway	Enter the IPv6 default gateway provided by ISP.
Mode	Specifies the method of the WAN port to obtain the IPv6 DNS server address.
DNS Obtain Method	Only Manual is allowed, which means entering the IPv6 DNS server address manually.
Primary DNS	Enter a correct IPv6 DNS server address.
Secondary DNS	 TIP If there is only one DNS address, Secondary DNS is not required.

Parameter	Description
Connection Status	Hardware Connection Specifies the current rate and duplex mode of the WAN port.
	Specifies the connection status of the WAN port of the router.
	– Connected: The WAN port of the router has been plugged into the Ethernet cable, and the IPv6 address information has been obtained.
	– Connecting...: The router is connecting to the upstream network device.
	– Disconnected: If it is not connected or fails to connect, check the Ethernet cable connection status and internet settings, or consult the corresponding ISP.
	Duration Specifies the duration of the WAN port access to the IPv6 network.
	IPv6 Address Specifies the IPv6 global unicast address of the WAN port.
	Subnet Prefix Length Specifies the network prefix number of the IPv6 address.
	Default Gateway Specifies the IPv6 default gateway of the WAN port.
	Primary DNS
	Specify the primary or secondary IPv6 DNS server address of the WAN port.
	Secondary DNS

9.5.2 Modify LAN

Start a web browser on a device that is connected to the router 1, visit **tendawifi.com**, and log in to router's web UI. Then go to **More > IPv6 > LAN**.

You can configure the IPv6 address of the corresponding VLAN so that multiple devices on the LAN can share the broadband server.

The VLAN is disabled by default. After it is enabled, the following information is displayed.

Parameter description

Parameter	Description
VLAN Interface	Specifies the VLAN interface for IPv6.
Status	Used to enable or disable the IPv6 function of the corresponding VLAN.
IPv6 Address Obtain Method	Specifies the method to obtain IPv6 addresses. Auto: The IPv6 address prefix of the VLAN is automatically obtained from upstream device by Prefix Delegation Port. The IPv6 address is automatically generated by the router according to the standard. Manual: You need to manually set the IPv6 address prefix, complete IPv6 address and address assignment mode of the VLAN.
Prefix Delegation Port	Specifies the WAN port which obtains the IPv6 address prefix of the VLAN from the upstream device. It needs to be selected when IPv6 Address Obtain Method is Auto .
IPv6 Address Prefix	Specifies the IPv6 address prefix of the VLAN.
IPv6 Address	Specifies the complete IPv6 address of the VLAN address.

Parameter	Description
Address Assignment Method	Specifies the method that the router uses to assign IPv6 addresses to LAN clients. – DHCPv6: The client directly obtains all IPv6 address information from the DHCPv6 server, including the DNS server. – SLAAC: The client automatically generates IPv6 address information through RA, including the IPv6 address and DNS server. – SLAAC+DHCPv6: The client automatically generates the IPv6 address through RA and obtains other address information from the DHCPv6 server, such as the DNS server.
Start Address	Specify the range of IPv6 addresses assigned by the DHCPv6 server.
End Address	When Address Assignment Method is DHCPv6 , you need to configure parameters.
Primary Lifetime	Specifies the primary lifetime of the IPv6 address lease. If the client does not receive RA within the primary lifetime, it will deactivate the IPv6 address and no longer use the IPv6 address to create new connections, but can still receive messages with this IPv6 address as the destination address.
Valid Lifetime	Specifies the valid lifetime of the IPv6 address lease. After expiration, the IPv6 address will be deleted and invalid, and all sessions will be disconnected.
Primary DNS	Specify the IP address of the primary or secondary DNS server that is assigned to the client.
Secondary DNS	 TIP For the LAN devices to access the internet properly, ensure that the primary DNS you entered is the correct IP address of the DNS server or DNS proxy.

10 System maintenance

Features available in the router may vary by model and software version. Router availability may also vary by region or ISP. All images, steps, and descriptions in this guide are only examples and may not reflect your actual router experience.

10.1 Modify system time

To make the time-related functions effective, ensure that the system time of the router is set correctly. The router supports Sync time with network time and Set system time manually. By default, **Sync Time with Network Time** is selected.

- Sync time with network time: The router automatically synchronizes its system time with the Network Time Server (NTS). As the router is connected to the internet, the system time is correct.
- Set system time manually: If you choose this method, you can manually set a system time for the router. Every time the router reboots, you need to reconfigure the system time.

Configuration procedure:

1. Start a web browser on a device that is connected to the router visit **tendawifi.com**, and log in to router's web UI.
2. Go to **Tool > System time**.
3. Modify the system time of the router.
 - Sync time with network time
 - 1) Select **Sync time with network time** for **Time Setup**.
 - 2) Set **Sync Period**: the interval at which the router synchronizes the system time with an internet time server.
 - 3) Select the time zone from the **Time Zone** menu.
 - Set system time manually
 - 1) Select **Set system time manually** for **Time Setup**.
 - 2) Click  to manually set the correct router time, or click **Sync with Local PC Time** to synchronize the time from the computer currently managing the router.

---End

10.2 Diagnostic tool

10.2.1 Ping

Ping is used to check whether the connection is correct and the connection quality.

Assume that you want to detect whether the link between the router and the Google management network (www.google.com) is unblocked.

To perform Ping test:

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **Tool > Diagnosis**.
3. Select **Ping** from the **Tool** drop-down list box.
4. Set **Egress Option** to the interface for the test, which is **WAN1** in this example.
5. Enter the IP address or domain name of the ping target, which is **www.google.com** in this example.
6. Set **Tx Packets** to the number of packets sent in the Ping test, which is **10** in this example.
7. Set **Tx Packet Size** to the size of packets sent in the Ping test, which is **10** in this example.
8. Click **Start**.

The screenshot shows a web interface titled "Diagnosis". It contains several configuration fields for a Ping test:

- Tool:** A dropdown menu with "Ping" selected.
- Egress Option:** A dropdown menu with "WAN1" selected.
- IP Address/Domain Name:** A text input field containing "www.google.com".
- Tx Packets:** A text input field containing "10", with a blue information icon to its right.
- Tx Packet Size:** A text input field containing "10", with a blue information icon to its right.

At the bottom of the form is a blue button labeled "Start".

-----End

The diagnosis result is shown in the lower part of the page. See the following figure. **Packet loss** below 100% confirms the link is viable.

10.2.2 Tracert

Tracert is used to detect the routes that a packet takes from a router to a destination host.

Assume that you want to detect the routes from the router to the Google management network (www.google.com).

To perform Tracert test:

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **Tool > Diagnosis**.
3. Select **Tracert** from the **Tool** drop-down list box.
4. Set **Egress Option** to the interface for the test, which is **WAN1** in this example.
5. Enter **IP Address/Domain Name** of the tracert target, which is **www.google.com** in this example.
6. Click **Start**.

-----End

The diagnosis result is shown in the lower part of the page. See the following figure.

10.2.3 Packet capture tool

Packet Capture Tool is a network data collection and analysis tool, which can completely intercept the specified data packets in the network to provide analysis.

Assume that you want to intercept all types of data packets from the router's LAN4 port. The IP address of the LAN4 port is 192.168.0.250, which belongs to **VLAN_Default**.

Configuration procedure:

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **Tool > Diagnosis**.
3. Select **Packet Capture Tool** from the **Tool** drop-down list box.
4. Set **Interface** to the VLAN interface to intercept data, which is **VLAN_Default** in this example.
5. Set **IP/MAC Address** of the LAN4 port, which is **192.168.0.250** in this example.
6. Set **Protocol**, which is **ALL** in this example.
7. Click **Start**.

Parameter description

Parameter	Description
Interface	Specifies the VLAN interface whose data will be intercepted.
IP/MAC Address	Specifies the IP address or MAC address whose data will be intercepted.  TIP If the IP address or MAC address does not exist in the network or is not under the VLAN, no packets will be intercepted.

Parameter	Description
Protocol	Specifies the protocol type of data to be intercepted. ALL indicates that ICMP, TCP, UDP and ARP are all included. – ICMP: Abbreviated for Internet Control Message Protocol. It is used to transmit control messages between IP hosts and routers, including whether the network or the host is reachable, and whether the route is available. – TCP: Abbreviated for Transmission Control Protocol. The connection is established through the three-way handshaking. When the communication is completed, the connection should be removed. It can only be used for end-to-end communication, such as Telnet and FTP. – UDP: Abbreviated for User Datagram Protocol. UDP data includes destination port and source port information. The communication does not require connection, and the broadcast transmission can be realized. Services using UDP include DNS and SNMP. – ARP: Abbreviated for Address Resolution Protocol. It is a TCP/IP protocol that obtains physical addresses based on IP addresses.

10.2.4 System diagnosis

You can view the status information of all processes in the system.

To perform system diagnosis:

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **Tool > Diagnosis**.
3. Select **System Diagnosis** from the **Tool** drop-down list box.
4. Click **Start**.

---End

10.2.5 Interface info

Using Diagnosis, you can view the interface information of the router, including the physical interface, bridging interface, tunnel interface and VLAN virtual interface. The bridging interface and the VLAN virtual interface are generated when the VLAN is created, but no VLAN virtual interface is generated when the VLAN is 0. The tunnel interface is generated when the SSID policy is created.

To check the interface information:

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **Tool > Diagnosis**.
3. Select **Interface Info** from the **Tool** drop-down list box.
4. Click **Start**.

10.3 Log center

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **Tool > Log Center**.

You can view the log information recorded by the router.

The log center records the **System Log**, **Operating Log** and **Running Log** of the router. In case of network failure, you can use the router's log center to troubleshoot the problem.

The time of the logs depends on the system time of the router. To make sure the time of the logs is correct, set correctly [System time](#) of the router first.

10.3.1 View system log

The **System Log** records events of the system, such as DHCP log, dial-up log.

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **Tool > Log Center > System Log**. Click the drop-down list box on this page. You can view certain log information of the router.

10.3.3 View running log

The **Running Log** records the information of the system process running and the interface status.

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **Tool > Log Center > Running Log**.

You can view certain information of the system process running and the interface status report of the router by selecting log types from the drop-down list box highlighted on the following figure.

Export All Delete All Interface Status Log 2023-10-18 → 2023-10-18 Search				
ID	Time ↓	Log Content	Operator	Module
1	2023-10-18 15:02:47	LAN3 is UP.	system	interface
2	2023-10-18 14:59:02	LAN4 is DOWN.	system	interface
3	2023-10-18 14:26:37	LAN4 is UP.	system	interface
4	2023-10-18 14:26:33	LAN4 is DOWN.	system	interface

10.4 System maintenance

10.4.1 View device info

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **Tool > Maintenance > Device Info**.

You can view the basic composition and usage of current system hardware, as well as system time and running time.

CPU Utilization	3%
Memory Utilization	34%
System Time	2023-06-08 15:24:46
System Uptime	6hour(s) 51minute(s) 8s

10.4.2 Restore & Backup

You can use the Backup function to copy the current configurations of the router to the local computer and use the Configuration Restoration function to restore the configurations of the router to the backed-up configurations.

You are recommended to back up the configuration after it is significantly changed. When the performance of your router decreases because of an improper configuration, or after you restore the router to factory settings, you can use this function to restore the configuration that has been backed up.

Backup

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **Tool > Maintenance > Restore & Backup**.
3. Click **Export**.

-----End

The browser will download a configuration file named **RouterCfm.cfg**.

If the message “This type of file can harm your computer. Do you want to keep RouterCfm.cfg anyway?” appears on the page, click **Keep**.

Restore

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **Tool > Maintenance > Restore & Backup**.
3. Click **Browse**, and select the configuration file you have backed up.

4. Click **Import**.
5. Confirm the prompt information, and click **OK**.

-----End

A reboot progress bar appears. When the progress bar reaches 100%, the router is restored successfully.

10.4.3 Factory settings restore

If the internet is inaccessible for unknown reasons, or you forget the login password, you can reset the router to resolve the problems.

The router supports two resetting methods:

- [Reset the device using web UI](#)
- [Reset the device using the Reset/Extend button](#)

After the reset, the default LAN IP address of the router is 192.168.0.1.

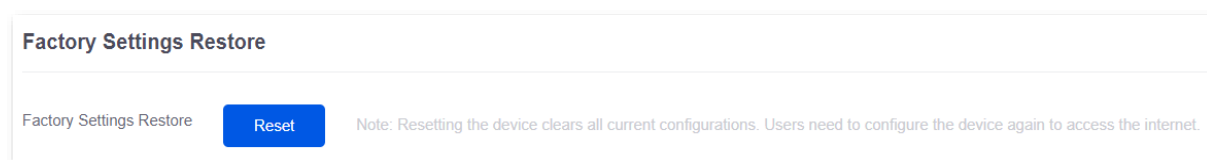

NOTE

- Resetting the router clears all current configurations. It is recommended to [back up](#) the current configurations before the reset.
- After the reset, the router will be restored to factory settings and you can access the internet only after you reconfigure it. Reset the router with caution.
- To avoid damaging the router, ensure that the router is properly powered on throughout the reset.

Reset the device using web UI

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **Tool > Maintenance > Factory Settings Restore**.
3. Click **Reset**.

4. Confirm the prompt information, and click **OK**.

----End

A reset progress bar appears. When the progress bar reaches 100%, the router is restored to factory settings successfully. Please configure the router again.

Reset the device using the Reset/Extend button

When using this method, you can restore the router to factory settings without logging in to the web UI of the router. The operation method is as follows:

When the **SYS** LED indicator is blinking, hold down the **Reset/Extend** button for about 8 seconds and release it when the **SYS** LED indicator light is solid green. When the **SYS** LED indicator blinks

again, the router is reset successfully.

10.5 Upgrade service

Using Upgrade Service, you can upgrade the system firmware and feature-library of the router to get a better user experience.

- **System firmware upgrade:** You can upgrade the system firmware of the router to experience more functions and get a better user experience. The router supports **Local Upgrade** and **Online Upgrade**. The default upgrade mode is **Local Upgrade**.
- **feature-library upgrade:** It enables you to upgrade the URL category in filter management module without updating the router's firmware. The router supports **Local Upgrade** and **Online Upgrade**. The default upgrade mode is **Local Upgrade**.

Parameter description

Parameter	Description
Local Upgrade	Download the upgrading file from the official website (www.tendacn.com) to the local computer, decompress it and upgrade the system using the decompressed file. The format of the decompressed file is ".bin".
Online Upgrade	When the router is connected to the internet, it will automatically detect whether there is a new program for upgrading and show the relevant information about the upgrading firmware detected. After you click Upgrade , the router will automatically download the upgrading file and perform upgrading. Do not power off the device during the process.

10.5.1 Upgrade system firmware

NOTE

- To avoid damage to the router, ensure that the correct upgrade file is used. Generally, a firmware upgrade file is suffixed with **.bin**.
- During the upgrade, do not power off the router.

1. Visit www.tendacn.com, download the upgrade firmware of the corresponding model to your computer and unzip it.
2. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **Tool > Upgrade Service > System Firmware Upgrade**.
3. Select **Local Upgrade** for **Upgrade Mode**.
4. Click **Browse**. Select and upload the firmware that has been downloaded to your computer in step 1, and click **Upgrade**.

System Firmware Upgrade

Current Software Version

V16.01.0.2(1767)

Upgrade Mode

☒ Local Upgrade
 ☐ Online Upgrade

Upgrade File Path

5. Confirm the prompt information, and click **OK**.

----End

After the progress bar completes, you can log in to the router again and check whether **Current Software Version** in **Tool > Upgrade Service > System Firmware Upgrade** is the one that you upgraded. If yes, the upgrade is successful.

To better experience the stability and new functions of the firmware, after the upgrade, you are recommended to [restore the router to factory settings](#) and configure it again.

10.5.2 Feature-Library upgrade

- To avoid damage to the router, ensure that the correct upgrade file is used. Generally, a feature-library upgrade file is suffixed with **.bin**.
- During the upgrade, do not power off the router.

1. Visit www.tendacn.com, download the feature-library of the corresponding model to your computer and unzip it.
2. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
3. Go to **Tool > Upgrade Service > Feature-Library Upgrade**.
4. Select **Local Upgrade** for **Upgrade Mode**.
5. Click **Browse**. Select and upload the feature-library that has been downloaded to your computer in step 1, and click **Upgrade**.

Feature-Library Upgrade

Current Software Version

v1.0

Upgrade File Path

- Confirm the prompt information, and click **OK**.

-----End

After the progress bar completes, you can log in to the router again and check whether **Current Software Version** in **Tool > Upgrade Service > Feature-Library Upgrade** is the one that you upgraded. If yes, the upgrade is successful.

10.6 Reboot devices

10.6.1 Reboot

You can reboot the router to make certain settings take effect and improve the performance of the router. Rebooting the device disconnects from the current network. The process lasts about 1 minute. It is recommended to reboot the device when the network is relatively idle.

Reboot steps:

- Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
- Go to **Tool > Reboot Services > Reboot**, and click **Reboot**.

Reboot

Rebooting the device disconnects from the current network. The process lasts about 1 minute.

- Confirm the prompt information, and click **OK**.

-----End

10.6.2 Scheduled reboot

By setting the router to reboot periodically during leisure time, you can prevent the decreasing of performance and instability of the router after running for a long period.

The time of reboot depends on the system time of the router. To make sure the time of the reboot is correct, set correctly [System time](#) of the router first.

Scheduled reboot steps:

1. Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI.
2. Go to **Tool > Maintenance > Scheduled Reboot**.
3. Select **Enable** for **Scheduled Reboot**.
4. Select the time when the router will automatically reboot, which is **03:00** in this example.
5. Select the reboot date, which is **Thur.** in this example.
6. Click **Save**.

The screenshot shows the 'Scheduled Reboot' configuration page. At the top, the title 'Scheduled Reboot' is displayed. Below it, there are two radio buttons: 'Enable' (selected) and 'Disable'. Underneath, the 'Reboot Time' is set to '03:00' with a clock icon. The 'Cycle' section shows 'Every Day' selected. Below that, there are checkboxes for the days of the week: Mon., Tues., Wed., Thur. (checked), Fri., Sat., and Sun. At the bottom, there is a blue 'Save' button.

-----End

After the above settings are completed, the router will automatically reboot at 3:00 am every Thursday.

10.7 View & modify system account

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **Tool > System Account**.

You can add, modify or delete the administrator and visitor accounts.

Parameter description

Parameter	Description
Role	Specifies the user role in managing the web UI. There is an administrator account by default. The operation authority of corresponding user roles is described as follows: Administrator: Able to view and configure all functions of the router. Visitor: Only able to view configurations of the router except system account information.
Password	Used to set the login password of the account.
Confirm Password	
Remark	Specifies the remark for the account. You can enter the description for the operation permission of the account.
Login IP Address Limit	Specifies the IP addresses of the users of the account. After the configuration, only users with the IP address or within the IP address range can use the account to access the web UI.

10.8 Perform a network test

Start a web browser on a device that is connected to the router, visit **tendawifi.com**, and log in to router's web UI. Then go to **Tool > Test**.

You can perform a network test on the WAN port of the router.

Test

Ethernet Port Selection WAN1

WAN Port Diagnosis Dynamic IP Address, Ethernet connected, Connected

DNS Diagnosis Normal

Delay Diagnosis 11ms

HTTP Access Diagnosis Normal

Test

Parameter description

Parameter	Description
Ethernet Port Selection	Specifies the WAN port to be tested.
WAN Port Diagnosis	Used to test the WAN port's connection type, Ethernet cable connection status and internet connection status.
DNS Diagnosis	Used to test whether the WAN port can resolve the domain name properly.
Delay Diagnosis	Used to test the network delay of the WAN port.
HTTP Access Diagnosis	Used to test whether the WAN port can receive HTTP response normally.

Appendix

A.1 Connect to a hidden WiFi

When a device connects to Hidden WiFi for the first time, you need to enter the WiFi name, security, and WiFi password of the Hidden WiFi on the device.

To connect to the hidden WiFi on your device (Example: iPhone):

Assume that the **Unify 2.4 GHz & 5 GHz** function is enabled and the WiFi parameters are:

- SSID: John_Doe
- Security: WPA-PSK/WPA2-PSK
- WiFi password: Tenda+Wireless245

If you do not remember the wireless parameters of the WiFi network, log in to the web UI of the router and go to **Wireless Settings** to find them.

1. Go to **Settings > WLAN**.
2. Turn on **WLAN**.
3. Scroll the Wi-Fi list to the bottom, and tap **Other....**
4. Enter the Wi-Fi name and password, which are **John_Doe** and **Tenda+Wireless245** in this example.
5. Set **Security** to **WPA2/WPA3** (If WPA2/WPA3 is not available, choose WPA2).
6. Tap **Join**.

---End

Wait for a while, and the phone successfully connects to the router's Wi-Fi **John_Doe**.

A.2 Acronyms and Abbreviations

Acronym and Abbreviation	Full Spelling
AES	Advanced Encryption Standard
AH	Authentication Header
AP	Access Point
APSD	Automatic Power Save Delivery
ARP	Address Resolution Protocol
AUTH	Authentication
CPU	Central Processing Unit
CRM	Customer Relationship Management
DDNS	Dynamic Domain Name Service
DDoS	Distributed Denial of Service
DES	Data Encryption Standard
DHCP	Dynamic Host Configuration Protocol
DHCPv6	Dynamic Host Configuration Protocol for IPv6
DMZ	Demilitarized Zone
DNS	Domain Name System
DPD	Dead Peer Detection
ERP	Enterprise Resource Planning
ESP	Encapsulating Security Payload
FQDN	Fully Qualified Domain Name
FTP	File Transfer Protocol
GI	Guard Interval
HTTP	Hypertext Transfer Protocol
HTTPS	Hypertext Transfer Protocol Secure
ICMP	Internet Control Message Protocol
